JetNet 6059G Series
Industrial Managed Gigabit Ethernet Switch
User's Manual

Declaration of CE

This product has passed the CE certification for environmental specifications. Test conditions for passing included the equipment being operated within an industrial enclosure. In order to protect the product from being damaged by ESD (Electrostatic Discharge) and EMI leakage, we strongly recommend the use of CE-compliant industrial enclosure products.

Federal Communications Commission (FCC) Statement

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his expense.

The user is cautioned that changes and modifications made to the equipment without approval of the manufacturer could void the user's authority to operate this equipment.

1 Introduction

Welcome to Industrial 9-port Managed Gigabit Ethernet Switch User Manual. Following topics are covered in this chapter:

1.1 Overview

1.2 Major Features

1.3 Package Checklist

1.1 Overview

The Industrial 9-port Managed Gigabit Ethernet Switches, have 4 10/100/1000Base-TX ports and 5 combo ports, respectively 10/100/1000 RJ-45 / 100-FX / Gigabit SX/LX. The Switch is especially designed to operate under harsh environmental conditions. The switches provide solid foundation for a highly fault-tolerant and easily-managed network. It can be remotely configured by Telnet, Web browser, JetView and managed by Simple Network Management Protocol (SNMP) and Remote Monitoring (RMON). You can also connect the attached RS232 console cable to manage the switch by Command Line Interface (CLI). CLI commands are Cisco-Like commands, your engineers who are familiar with Cisco products don't need to learn new rules for CLI commands.

Security is enhanced with advanced features such as 802.1Q VLAN and Port/IP security. Performance is optimized by QoS and IGMP Snooping/Query. Korenix 3nd generation Ring technology, Multiple Super Ring, enables superb self-healing capability for network failure. The fastest failover time is enhanced from 300ms to 5ms for 10/100TX RJ-45 ports, and 30ms for 100FX and Gigabit Fiber. This is Korenix patented ring technology, which is registered in most countries. For interoperability with your existed network, the Switch also comes with an advanced redundant network solution, Ring Coupling and Rapid Dual Homing technology. With Ring Coupling and Rapid Dual Homing technology, Ethernet Ring can be extended more easily. No matter with Korenix switch or other managed switches.

The IP31-design aluminum case further strengthens Switch's withstand ability in harsh industrial environment. The event warning is notified to the network administrator via e-mail, system log, or to field engineers by relay output. The Industrial Managed Gigabit Ethernet Switch has also passed CE/ FCC certifications to help ensure safe and reliable data transmission

for industrial applications. It will be your best choice for highly-managed industrial network.

1.2 Major Features

The Switch has the following features:

- 4 Gigabit copper ports, 5 Gigabit copper/SFP combo ports to extend Giga Copper/Fiber uplink or Giga Copper/Fiber Ring connection
- SFP support 100/1000 Fiber with Digital Diagnostic Monitoring (DDM) for transmission quality monitoring
- Independent 100Mbps / 1000Mbps SFP speed indication
- 32Gbps switch Fabric, 8K MAC address to ensure High Quality Data transmission
- Isolated out-band management interface for negative power system.
- Korenix patented MSR® pattern aggregates up to 4 x 1000M Rings for critical data stream redundancy
- IEEE 802.1AB LLDP and optional JetView Pro i2NMS software for auto-topology and group management
- Advanced management by LACP/ 256 VLANs/ GVRP/ QoS/ IGMP Snooping/Rate Control/ Online Multi-Port Mirroring/DHCP option 82
- Advanced Security system by Port Security, Access IP list, SSH (Secure Shell) for Telenet security and Hypertext Transfer Protocol Secure (HTTPS) with SSL protocol for Web Browsering Security
- Event Notification through E-mail, SNMP trap and SysLog
- Cisco-Like CLI, Web, SNMP/RMON for network Management
- Compliant with NEMA -TS2 /Marintime/ Railway EMC inquires
- Dual redundant 10.5~60VDC power inputs for system reliability
- AC 1.5KV Hi-pot isolation and -25~70℃ operating temperature for harsh environments. -40~75℃: -w model ; UL 60950-1 enviroment: -25~60°C or -40~60°C.

The detail specifications is listed in Appendix- 5.1

Note-1: those certifications are pending for special project request, please contacts your sales contact window.

1.3 Package List

The Switch is shipped with following items:

- Ethernet Switch x1
- One DIN-Rail clip (attached to the switch)
- One wall mounting plate
- One RS-232 DB-9 to RJ-45 console cable
- CD User manual x 1
- Quick Installation Guide (QIG)

JetNet 6059G

DB-9 to RJ-45 Cable

CD User Manual

QIG

If any of the above items is missing or damaged, please contact your local sales representative.

2 Hardware Installation

This chapter includes hardware introduction, installation and configuration information. Following topics are covered in this chapter:

2.1 Hardware Introduction

Dimension

Panel Layout

Bottom View

2.2 Wiring Power Inputs

2.3 Wiring Digital Input

2.4 Wiring Relay Output

2.5 Wiring Ethernet Ports

2.6 Wiring Combo Ports

2.7 Wiring RS-232 console cable

2.8 DIN-Rail Mounting Installation

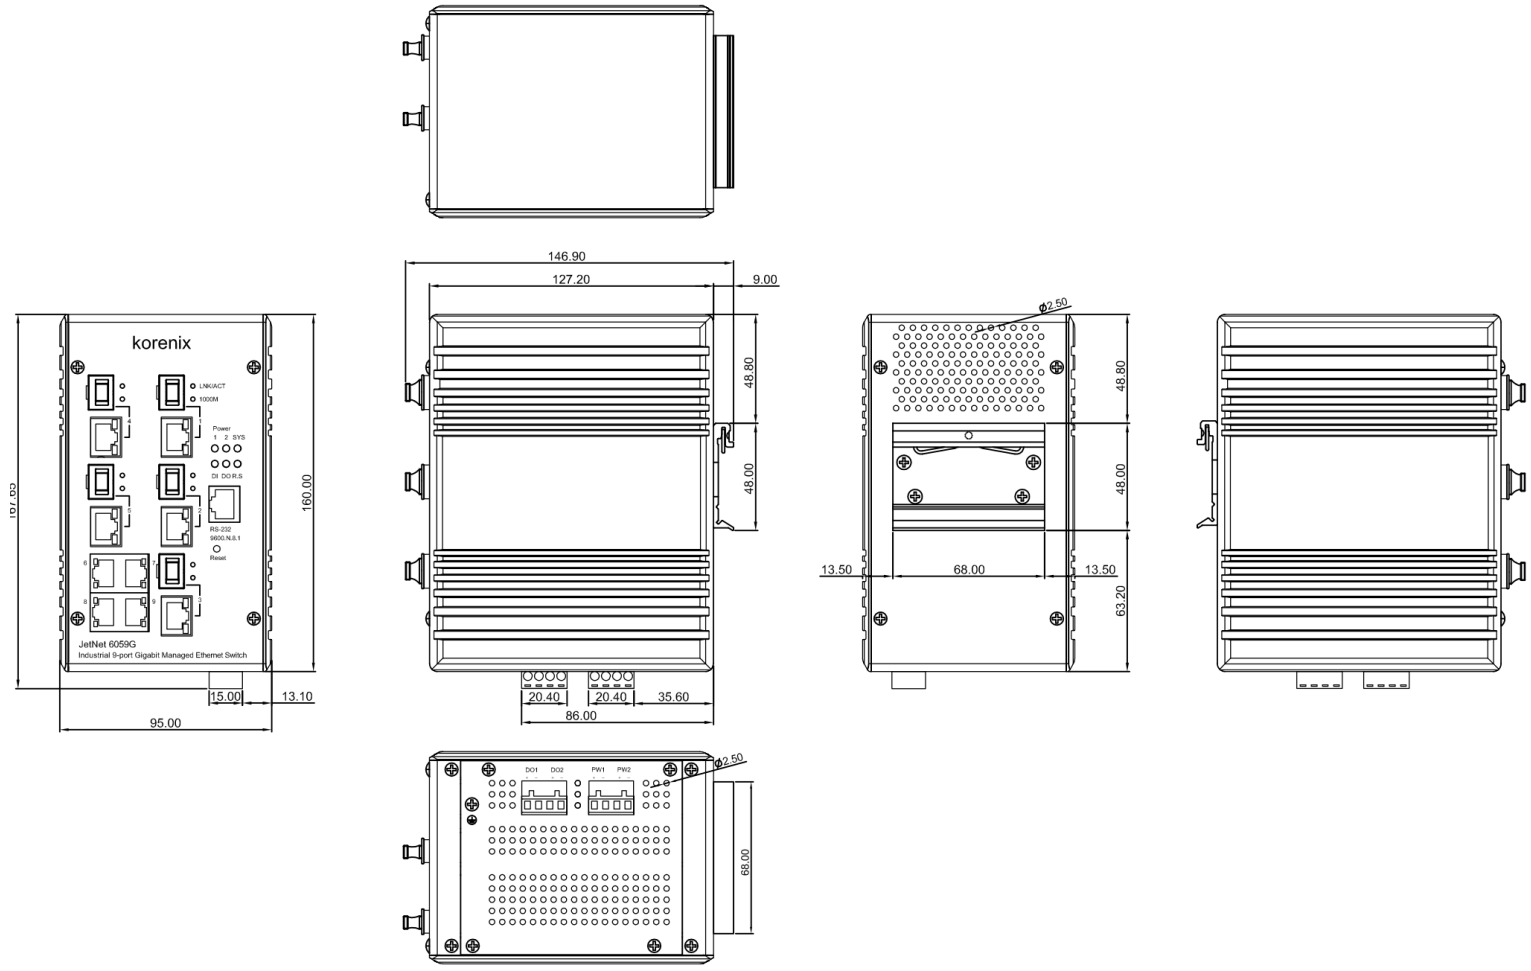
2.9 Wall-Mounting Installation

2.1 Hardware Introduction

Dimension

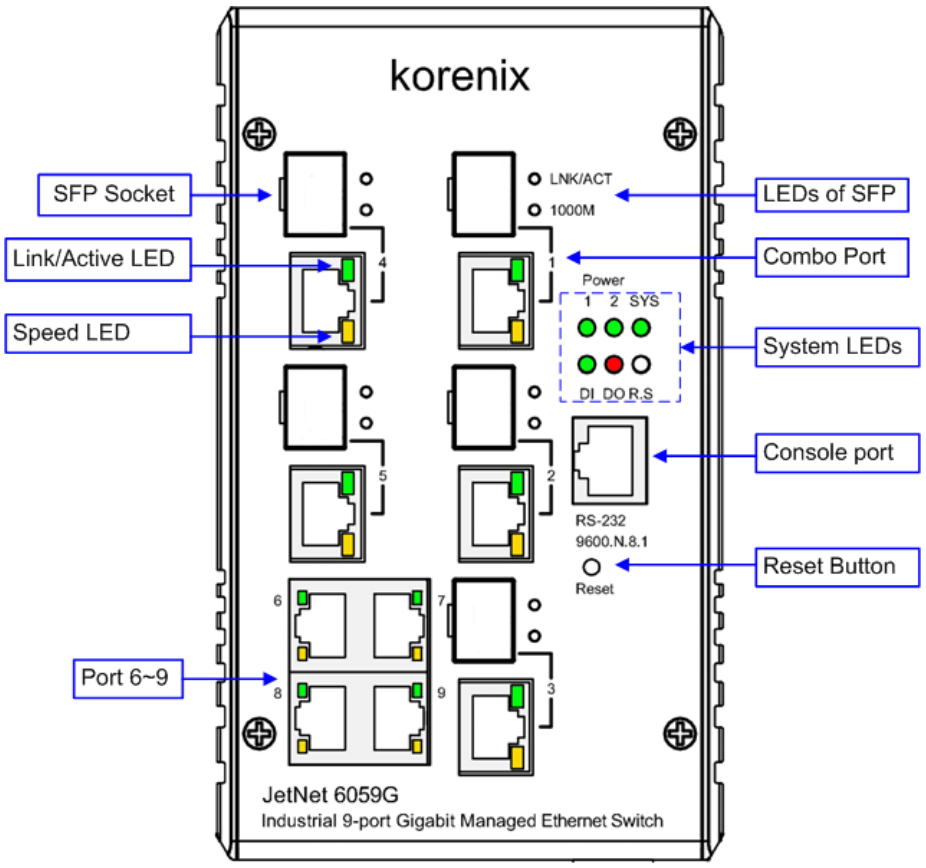
The industrial 9-port Gigabit managed Switch dimension is: **95mm x 167.65mm x 127.2mm** (W x H x D), w/o DIN Rail

95mm x 167.65mm x 146.9mm (W x H x D), w/o DIN Rail Clip



Front Panel Layout

The front panel includes 10/100/1000Mbps Gigabit Ethernet ports, SFP slot, RS232 console port, Reset button and LEDs for system and port indication.

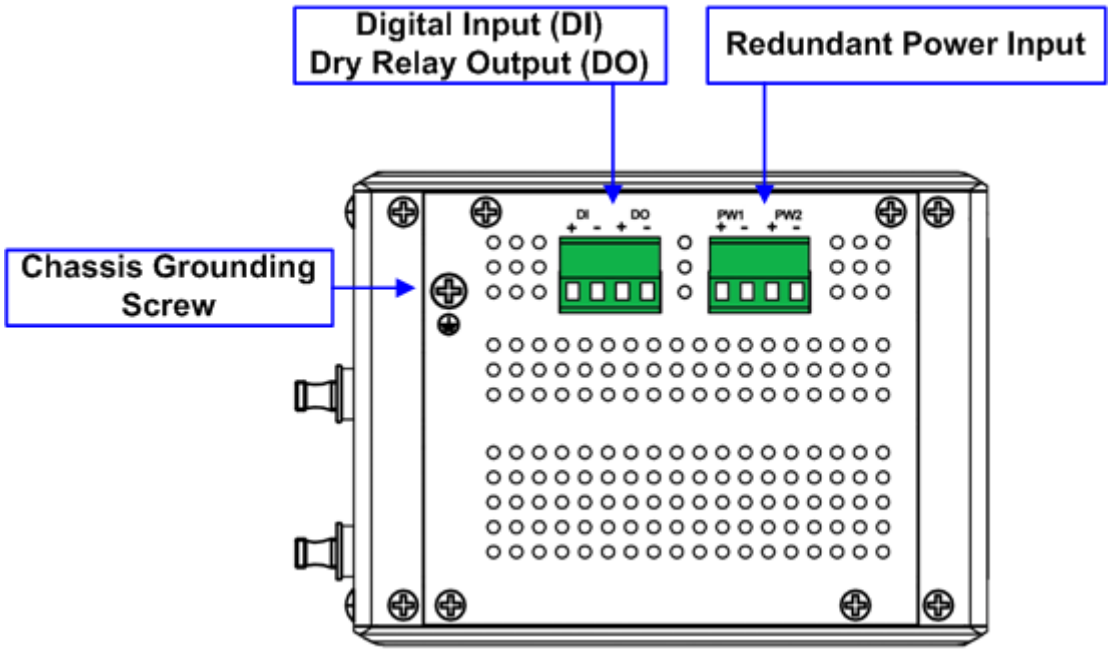


The LED function is decribed as following table:

LED	Function	Behaviors
Power 1,2	Indicates the power input status	On: the input connector is on applying power.
SYS	Indicates the system operating status	Green On: System is ready to operating
D.I.	Indicates the digital input status	On: High level signal is applied
D.O.	Indicates the digital output (Relay output) status	On: the output is formed close circuit
R.S.	Indicates the ring operating status.	Ring Status: Green on (Ring normal) /Blinking (Ring with wrong port); Yellow on (Ring abnormal) / Blinking (device's ring port failed)
Link/Active	Indicates the traffic status and link status	Green On: port is linked with partner. Blinking: the traffic is active.
Speed	Indicates the copper port link speed	Yellow On: port is link at 1000Mbps. Yellow Off: port is link at 100Mbps or 10Mbps.
1000M	SFP transceiver speed indication	On: the SFP transceiver supports 1000Mbps

Bottom View

The bottom view of the the Industrial 9-port Gigabit Managed Switch consists of two terminal block connectors with two DC power inputs, one Digital Input (DI), one Relay Output (DO) and one Chassis Grounding screw.

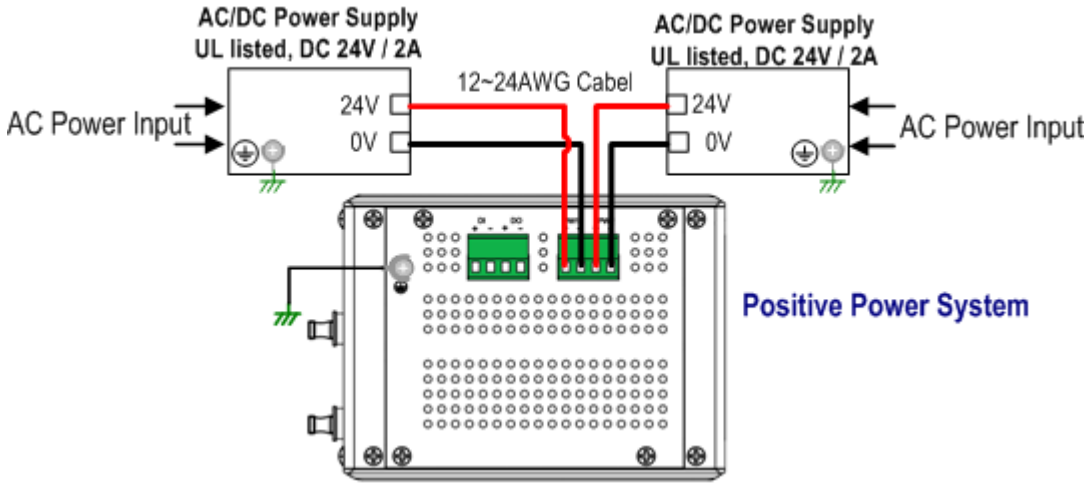


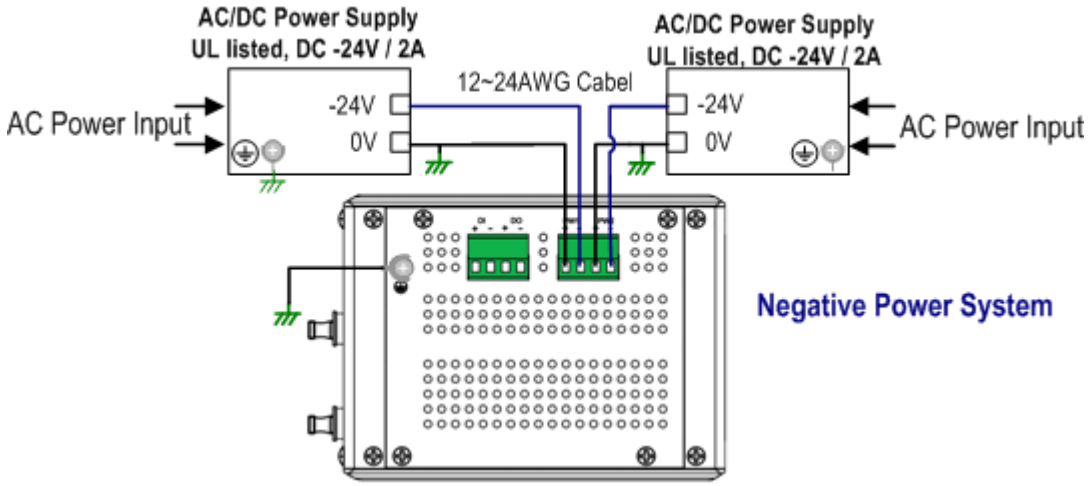
Note: The unit intended to use vertical direction, with DIN-rail or wall-mount only.

2.2 Wiring the Power Inputs

Follow below steps to wire the Switch's redundant DC power inputs.

1. Insert positive and negative wires into V+ and V- contacts respectively of the terminal block connector
2. Tighten the wire-clamp screws to prevent DC wires from being loosened.
3. Power 1 and Power 2 support power redundancy and polarity reverse protect function. That means with wrong polarity, the system won't work.
4. Positive and negative power system inputs are both accepted, but Power 1 and Power 2 must apply with same mode as following figures.





Note 1: It is a good practice to turn off input and load power, and to unplug power terminal block before making wire connections. Otherwise, your screwdriver blade can inadvertently short your terminal connections to the grounded enclosure.

Note 2: The range of the suitable electric wire is from 12 to 24 AWG.

Note 3: If the 2 power inputs are connected, the Switch will be powered from the highest connected voltage. The unit will alarm for loss of power, either PWR1 or PWR2.

Note 4: To use the **UL Listed LPS Power supply** with output Rating 10.5-60 Vdc, minimum 2 A. Here, we recommended use DC 24V as the operating voltage.

Note 5: Both of power inputs should apply with same electrical power system; mixing positive and negative electrical power system will make system damage.

Note 6: Once power on the device, the system LED will activate by the sequence as table following:

Indicators	Stage 1	Stage 2	Stage 3	Stage 4	Stage 5	Stage 6
Power LED	On	On	On	On	On	On
DI	Off	On	Off	Off	Off	Off
DO	Off	Off	On	Off	Off	Off
R.S.	Off	Off	Off	On	Off	Off
SYS	Off	Off	Off	Off	Off	On
Description	Power on	Ex. Booter	Ld. firmware	Ex. firmware	System booting	System Ready

(Ex: executes; Ld: Load)

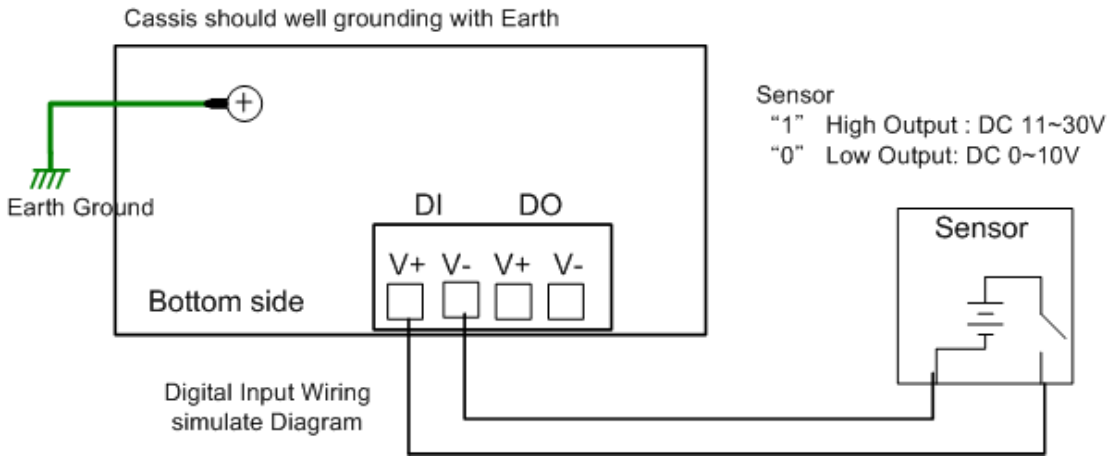
By those LED indicators, we can know the exactly stage is performed by system during the power on.

2.3 Wiring Digital Input

The Switch provides one digital input. It allows users to connect the termination units' digital output and manage/monitor the status of the connected unit. The Digital Input pin can be pulled high or low; thus the connected equipments can actively drive these pins high or low. The embedded software UI allows you to read and set the value to the connected device.

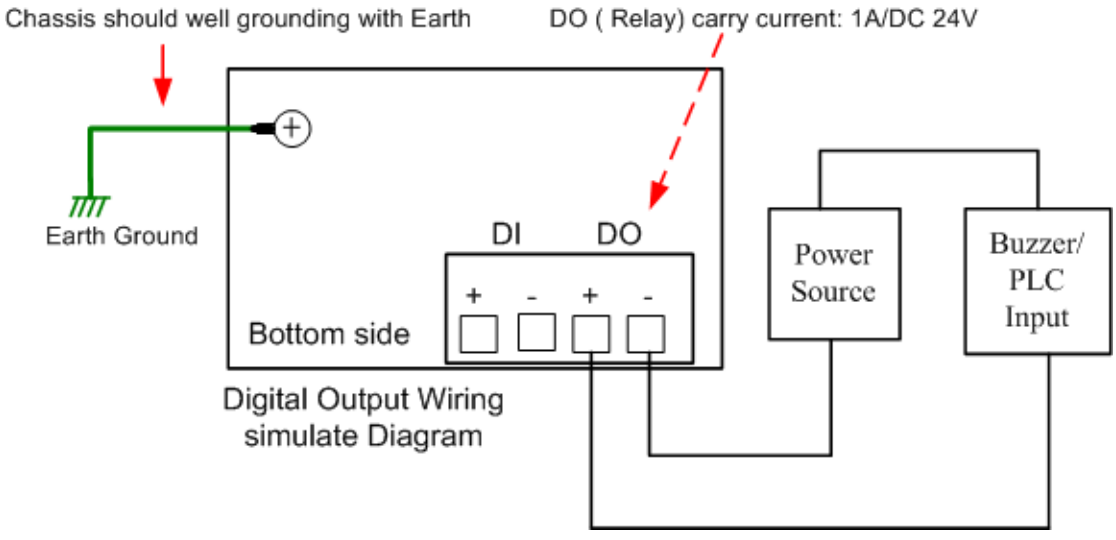
The power input voltage of logic low is DC 0~10V. Logic high is DC 11~30V.

.



2.4 Wiring Digital Output

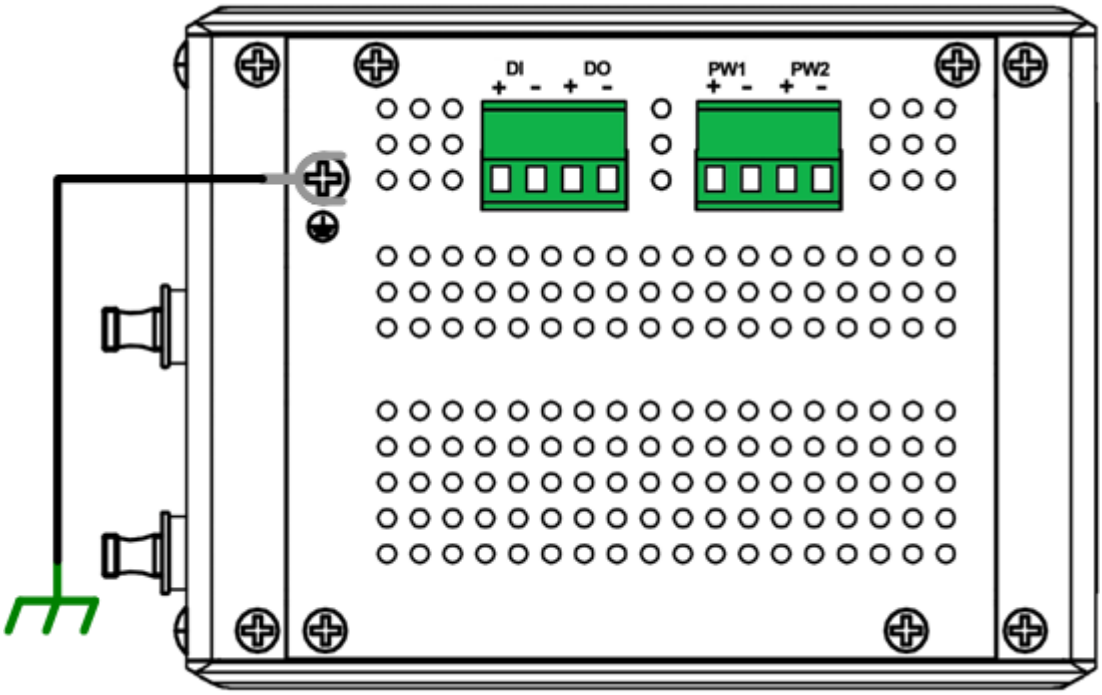
The Switch provides one digital output, also known as Dry Relay Output. The relay contacts are energized (open) for normal operation and will close for fault conditions. The fault conditions include power failure, Ethernet port link break or other pre-defined events which can be configured in Switch's UI.



2.5 Wiring Earth Ground

To ensure the system will not be damaged by noise or any electrical shock, we suggest you to make exact connection between the Switch and Earth Grounding system.

On the bottom side of the Switch, there is one earth ground screw. Loosen the earth ground screw by screw drive; then tighten the screw after earth ground wire is well connected.



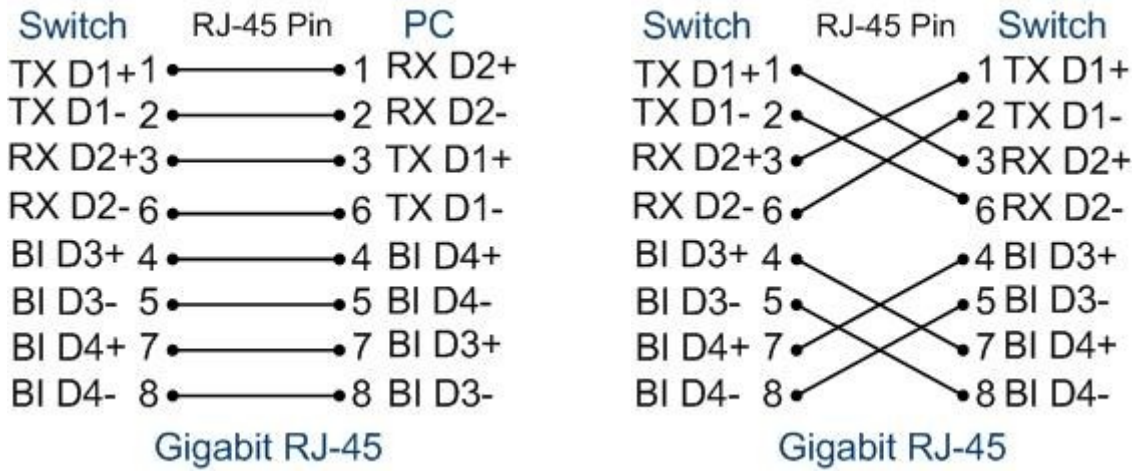
Chassis Connects to the earth ground

2.6 Wiring Gigabit Ethernet RJ-45 Ports

The Ethernet Switch adopts 9 ports RJ-45 connectors which support 10/100Mbps Half/Full duplex, 1000Mbps full duplex with auto MDI/MDI-X functions and auto negotiation; there are 5 in 9 ports RJ-45 are combo with SFP socket which supports optical fiber communication that can support 100Mbps and 1000Mbps SFP Transceiver with Digital Diagnostic Monitor (DDM) feature to achieves fiber signal quality control.

All the RJ-45 ports will auto-detect the signal from connected devices to negotiate the link speed and duplex mode. Auto MDI/MDIX allows users to connect another switch, hub or workstation without changing straight through or crossover cable.

Note: that crossover cables simply cross-connect the transmit lines at each end to the received lines at the opposite end.



Connect one side of an Ethernet cable into any switch port and connect the other side to your attached device. The LNK LED will light up when the cable is correctly connected. Refer to the LED Indicators section for descriptions of each LED indicator. Always make sure that the cables between the switches and attached devices (e.g. switch, hub, or workstation) are less than 100 meters (328 feet).

The supports cable types are as below.

1000 Base-TX: 4-pair UTP/STP Cat. 5e cable, EIA/TIA-568B 100-ohm (100 meters)

10/100Base-TX: 4-pair UTP/STP Cat. 5 Cable, EIA/TIA-568B 100-ohm (100 meters)

2.7 Wiring Combo Ports – SFP

The Switch includes 5 RJ-45/ SFP socket combo ports. The speed of the gigabit Ethernet RJ-45 port supports 10Base-T, 100Base-TX and 1000Base-T. It also equips 5 gigabit SFP ports combo with gigabit Ethernet RJ-45 ports. The speed of the SFP port supports 100Base-FX and 1000Base-SX/LX and accepts standard MINI GBIC SFP transceiver. For the system reliability, Korenix recommends using the Korenix certificated Gigabit SFP Transceiver, especially the DDM function. Korenix's DDM type of SFP transceiver have modified with higher accuracy. With the non-certified DDM SFP transceiver, the DDM features will be disabled.

To keep best performance, the SFP fiber ports will not support Fiber Link First function anymore after firmware version v1.1; Since, the SFP fiber transceiver vendor have applied energy saving technology and changed the circuit design that will cause SFP transceiver can't offer energy of fiber link signature to switches the connection from RJ-45 to fiber, even the SFP fiber transceiver already link up.

To fix that issue, new firmware have applied plug-in and switch to fiber mode feature. It forced the connection change from RJ-45 to SFP immediately, once the SFP transceiver inserted and detected by CPU.

Note: The Ethernet Switch has to use UL recognized fiber transceiver with Class 1 Laser/LED Diode.
Note: It is recommended don't plug-in SFP fiber transceiver and link up RJ-45 port at same time, it might cause the connection does not work properly.

2.8 Wiring RS-232 Console Cable

There is one RS-232 DB-9 to RJ-45 cable shipped with the box. Connects the DB-9 connector to the COM port of your PC, open Terminal tool and configure the serial communication parameter to 9600, N, 8, 1. (Baud Rate: 9600bps / Parity: None / Data length: 8bits / Stop Bit: 1) Then you can access CLI interface by console cable.

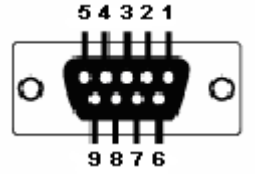
The RS-232 interface is uses isolated design and the RJ-45 shield is connects to chassis grounding. Be sure the console cable you connected is not shielded when it connects to DTE (desktop PC) which uses different electrical power system.

Note: If you lost the cable, please contact with your sales or follow the pin assignment to buy a new one. The Pin assignment spec is listed following.

RJ-45 Pin	DB-9 Pin	Description
1	8	N/A
2	9	N/A
3	**2**	**TxD**
4	1	N/A
5	**5**	**GND**
6	**3**	**RxD**
7	4	N/A
8	7	N/A

(Updated pin assignment)

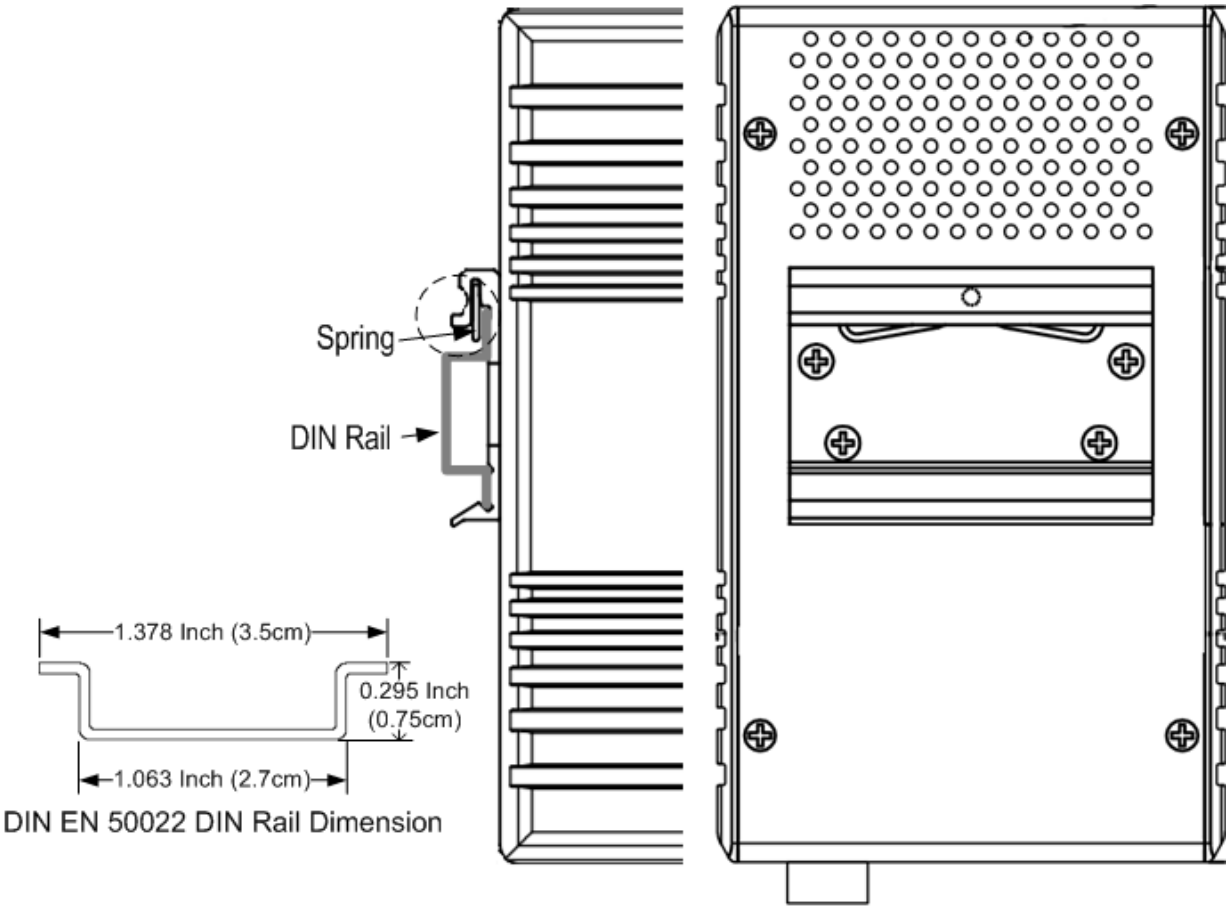
DB-9 Female Connector



2.9 DIN-Rail Mounting Installation

The DIN-Rail clip is already screwed tighten on the rear side of Switch when shipping. If the DIN-Rail clip is not screwed on the Ethernet-Switch, contact your sales respresentive.

The DIN rail clip supports EN50022 standard. In the diagram following includes the dimension of EN50022 DI rail for your refer.



Follow the steps below to mount the Switch to the DIN-Rail track:

1. First, insert the DIN-Rail track upper side into the upper end of DIN-Rail clip.
2. Lightly push the bottom of DIN-Rail clip into the track.
3. Check if DIN-Rail clip is tightly attached on the track.
4. To remove Switch from the track, reverse the steps above.

Notes: The DIN Rail should compliance with DIN EN50022 standard. Using wrong DIN rail may cause system install unsafe.

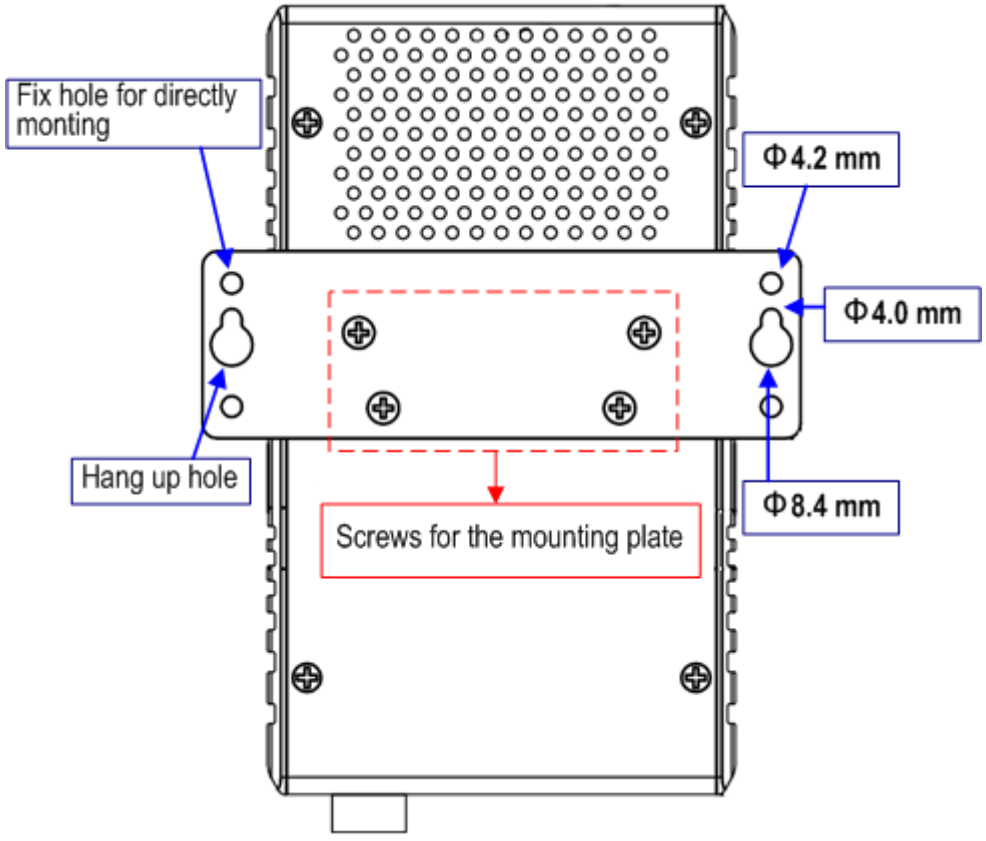
2.10 Wall-Mounting Installation

Follow the steps below to install the Switch with the wall mounting plate.

1. To remove DIN-Rail clip from Switch, loosen the screws from DIN-Rail clip.
2. Place the wall mounting plate on the rear panel of Switch.
3. Uses the screws loosed from the DIN rail to screw tighten the mounting plate onto the Switch.
4. Use the hook holes at the corners of the wall mounting plate to hang or screw on JetNet Switch onto the wall. Following screw specifications are for different mounting ways.

   Screw and hang on the wall (8.4mm hang-hole): uses M3 screw with screw nut diameter between 5mm to 8.4mm).

   Directly screw on the wall (4.2mm screw-hole): uses M3 screw with nut diameter over 5mm.
5. To remove the wall mounting plate, reverse the steps above.



Note: To avoid damage the internal circuit, be sure use the screw included in the package to

screw and tight the wall-mount kit onto the rear side of the Switch. The specification of screw is M3 in 6 mm length.

3 Preparation for Management

The Industrial Managed Gigabit Switch provides both in-band and out-band configuration methods. You can configure the switch via RS232 console port via serial cable attached in the package if you don't attach your admin PC to your network, or if you lose network connection to the target . This is so-called out-band management. It wouldn't be affected by network performance.

The in-band management means you can remotely manage the switch via the Ethernet network. You can choose Telnet or Web-based management. You just need to know the device's IP address and you can remotely connect to its embedded HTTP web pages or Telnet console.

Following topics are covered in this chapter:

3.1 Preparation for Serial Console

3.2 Preparation for Web Interface

3.3 Preparation for Telnet console

3.1 Preparation for Serial Console

In the shipping package, it has attached one RS-232 DB-9 to RJ-45 console cable. Please attach RS-232 DB-9 connector to your PC COM port, connect RJ-45 to the Console port of the Managed Switch. If you lose the cable, please follow the console cable PIN assignment to find one (Refer to session 2.8), or contact your sales representative too purchase a new cable.

1. Go to Start -> Program -> Accessories -> Communication -> Hyper Terminal
2. Give a name to the new console connection.
3. Choose the COM name
4. Select correct serial settings. The serial settings of Swtch are as below:

   Baud Rate: 9600 / Parity: None / Data Bit: 8 / Stop Bit: 1

5. After connected, you can see Switch login request.
6. Login the switch. The default username is “admin”, and password is “admin”.

3.2 Preparation for Web Interface

The Switch provides HTTP Web Interface and Secured HTTPS Web Interface for web management.

3.2.1 Web Interface

Korenix web management page is developed by JAVA. It allows you to use a standard web-browser such as Microsoft IE, or Mozilla, to configure and interrogate the switch from anywhere on the network.

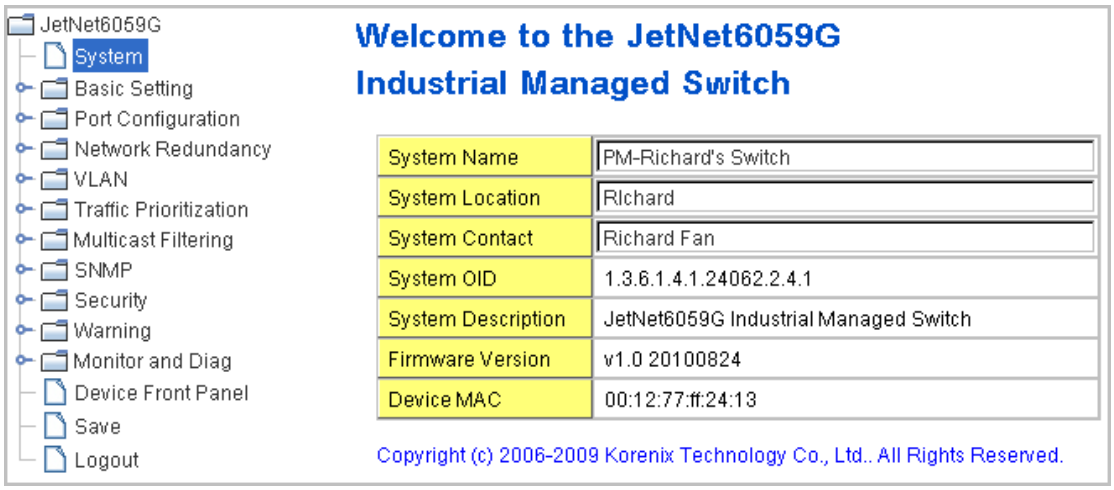
Before you attempt to use the embedded web interface to manage switch operation, verify that your Industrial Ethernet Switch is properly installed on your network and that every PC on this network can access the switch via the web browser.

1. Verify that your network interface card (NIC) is operational, and that your operating system supports TCP/IP protocol.
2. Wire DC power to the switch and connect your switch to your computer.
3. Make sure that the Switch's default IP address is 192.168.10.1.
4. Change your computer IP address to 192.168.10.2 or other IP address which is located in the 192.168.10.x (Network Mask: 255.255.255.0) subnet.
5. Switch to DOS command mode and ping 192.168.10.1 to verify a normal response time.

Launch the web browser and Login.

6. Launch the web browser (Internet Explorer or **Mozilla Firefox**) on the PC.
7. Type **http://192.168.10.1** (or the IP address of the switch). And then press **Enter**.
8. The login screen will appear next.
9. Select the language type. The default is English. This feature is available from firmware v1.1a.
10. Key in user name and the password. Default user name and password are both **admin**.

Click on **Enter** or **OK**. Welcome page of the web-based management interface will then appear.



English style Web UI

簡體中文 瀏覽器頁面

Once you enter the web-based management interface, you can freely change the JetNet's IP address to fit your network environment.

Note 1: IE 5.0 or later versions do not allow Java applets to open sockets by default. Users have to directly modify the browser settings to selectively enable Java applets to use network ports.

Note 2: The Web UI connection session of the Switch will be logged out automatically if you don't give any input after 30 seconds. After logged out, you should re-login and key in correct user name and password again.

3.2.2 Secured Web Interface

The embedded Web Server also provides secured management HTTPS login. All the configuration commands will be secured and will be hard for the hackers to sniff the login password and configuration commands.

Launch the web browser and Login.

1. Launch the web browser (Internet Explorer or **Mozilla Firefox**) on the PC.
2. Type **https://192.168.10.1** (or the IP address of the switch). And then press **Enter**.
3. The popup screen will appear and request you to trust the secured HTTPS connection distributed by Switch first. Click "**Yes**" to trust it.

4. The login screen will appear next. It also provides the langage selection.

5. Key in the user name and the password. The default user name and password is **admin**.
6. Click on **Enter** or **OK.** Welcome page of the web-based management interface will then appear.
7. Once you enter the web-based management interface, all the commands you see are the same as what you see by HTTP login.

3.3 Preparation for Telnet Console

3.3.1 Telnet

The Managed Switch also supports Telnet console and with telnet security feature- SSH. You can connect to the switch by Telnet and the command lines are the same as what you see by RS232 console port. Below are the steps to open Telnet connection to the switch.

1. Go to Start -> Run -> cmd. And then press **Enter**
2. Type the **Telnet 192.168.10.1** (or the IP address of the switch). And then press **Enter**

3.3.2 SSH (Secure Shell)

The Switch also support **SSH** (Security Shell) console for security. You can remotely connect to the switch by command line interface. The **SSH** connection can secure all the configuration commands you sent to the switch.

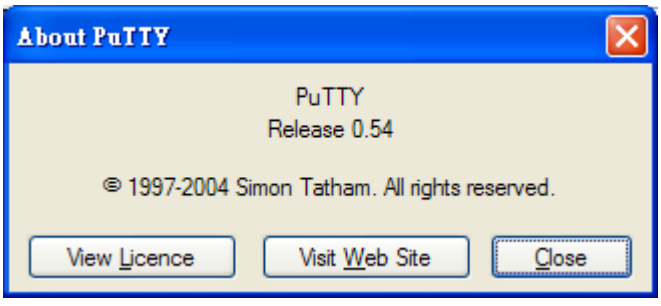
SSH is a client/server architecture while the Switch is perform as a **SSH** server. When you want to make SSH connection with the switch, you should download the SSH client tool first.

SSH Client

There are many free, sharewares, trials or charged SSH clients you can find on the internet. Fox example, **PuTTY** is a free and popular **Telnet/SSH** client. We'll use this tool to demonstrate how to login JetNet by SSH. Note: *PuTTY is copyright 1997-2006 Simon Tatham*.

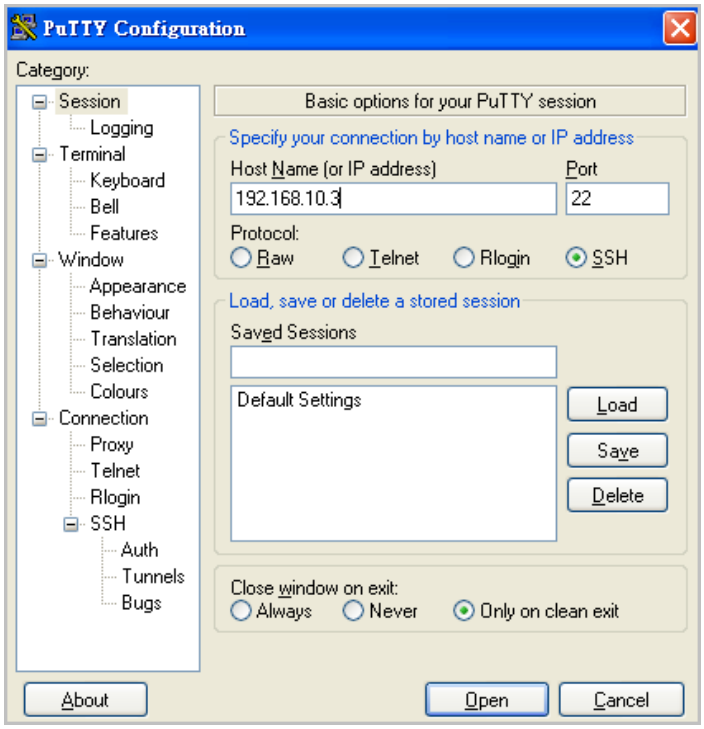
Download PuTTY:
http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html

The copyright of **PuTTY**

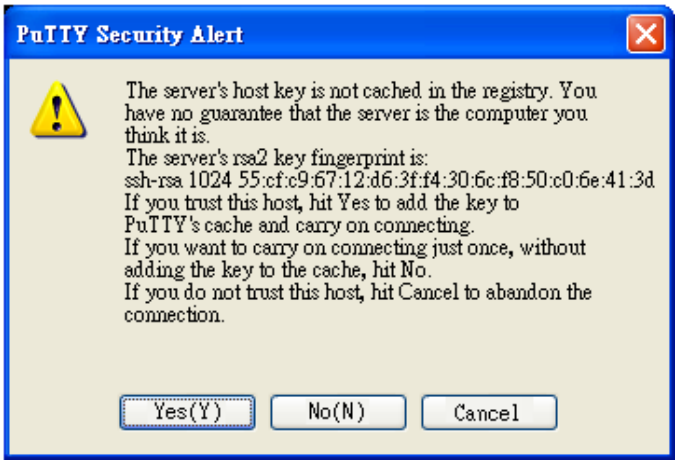


1. Open SSH Client/PuTTY

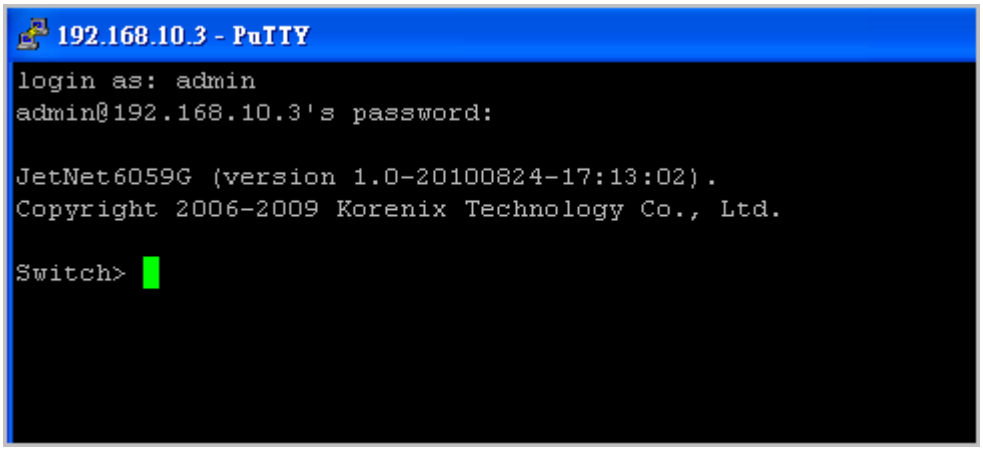
In the **Session** configuration, enter the **Host Name** (IP Address of your JetNet Switch) and **Port number** (default = 22). Choose the "**SSH**" protocol. Then click on "**Open**" to start the SSH session console.



2. After click on **Open**, then you can see the cipher information in the popup screen. Click " **Yes(Y)"** to accept the Security Alert.



3. After few seconds, the SSH connection of the Switch will be created and start communicate. You can see the login screen as the below figure.



4. Type the Login Name and its Password. The default Login Name and Password are **admin / admin**.
5. All the commands you see in **SSH** are the same as the CLI commands you see via RS232 console. The next chapter will introduce in detail how to use command line to configure the switch.

4 Feature Configuration

This chapter explains how to configure the Switch's software features. There are four ways to access the switch: Serial console, Telnet, Web browser and SNMP.

The Industrial Managed Switch provides both in-band and out-band configuration methods. You can configure the switch via RS232 console cable if you don't attach your admin PC to your network, or if you lose the network connection to your Switch. This is so-called out-band management. It wouldn't be affected by the network performance.

The in-band management means you can remotely manage the switch via the network. You can choose Telnet or Web-based management. You just need to know the device's IP address. Then you can remotely connect to its embedded HTML web pages or Telnet console.

The Switch's Web management interface is developed by JAVA. It allows you to use a standard web-browser such as **Microsoft Internet Explore**r, or **Mozilla Firefox**, to configure and interrogate the switch from anywhere on the network.

Note: IE 5.0 or later versions do not allow Java applets to open sockets by default. Users have to directly modify the browser settings to selectively enable Java applets to use network ports.

Following topics are covered in this chapter:

4.1 Command Line Interface (CLI) Introduction

4.2 Basic Setting

4.3 Port Configuration

4.4 Network Redundancy

4.5 VLAN

4.6 Traffic Prioritization

4.7 Multicast Filtering

4.8 SNMP

4.9 Security

4.10 Warning

4.11 Monitor and Diag

4.12 Device Front Panel

4.13 Save

4.14 Logout

4.1 Command Line Interface Introduction

The Command Line Interface (CLI) is the user interface to the switch's embedded software system. You can view the system information, show the status, configure the switch and receive a response back from the system by keying in a command.

There are some different command modes. Each command mode has its own access ability, available command lines and uses different command lines to enter and exit. These modes are User EXEC, Privileged EXEC, Global Configuration, (Port/VLAN) Interface Configuration modes.

User EXEC mode: As long as you login the switch by CLI. You are in the User EXEC mode. You can ping, telnet remote device, and show some basic information.

Type "**enable"** to enter next mode, **exit** to logout. **?** to see the command list

```
Switch>
  enable      Turn on privileged mode command
  exit        Exit current mode and down to previous mode
  list        Print command list
  ping        Send echo messages
  quit        Exit current mode and down to previous mode
  show        Show running system information
  telnet      Open a telnet connection
  traceroute  Trace route to destination
```

Privileged EXEC mode: Press enable in the User EXEC mode, then you can enter the Privileged EXEC mode. In this mode, the system allows you to view current configuration, reset default, reload switch, show system information, save configuration…and enter the global configuration mode.

Type **configure terminal** to enter next mode, **exit** to leave. **?** to see the command list

```
Switch#
  archive     manage archive files
  clear       Reset functions
  clock       Configure time-of-day clock
  configure   Configuration from vty interface
  copy        Copy from one file to another
  debug       Debugging functions (see also 'undebug')
  disable     Turn off privileged mode command
  end         End current mode and change to enable mode
  exit        Exit current mode and down to previous mode
  list        Print command list
  more        Display the contents of a file
  no          Negate a command or set its defaults
  ping        Send echo messages
  quit        Exit current mode and down to previous mode
  reboot      Reboot system
  reload      copy a default-config file to replace the current one
  show        Show running system information
  telnet      Open a telnet connection
  terminal    Set terminal line parameters
  traceroute  Trace route to destination
  write       Write running configuration to memory, network, or terminal
```

Global Configuration Mode: Press **configure terminal** in privileged EXEC mode. You can then enter global configuration mode. In global configuration mode, you can configure all the features that the system provides you.

Type **interface IFNAME/VLAN** to enter interface configuration mode, type "**exit** " to leave this configuration level and "**?** " to list all of commands.

Available command lists of global configuration mode.

```
Switch# configure terminal
Switch(config)#
  access-list          Add an access list entry
  administrator        Administrator account setting
  arp                  Set a static ARP entry
  clock                Configure time-of-day clock
  default              Set a command to its defaults
  end                  End current mode and change to enable mode
  exit                 Exit current mode and down to previous mode
  gvrp                 GARP VLAN Registration Protocol
  hostname             Set system's network name
  interface            Select an interface to configure
  ip                   IP information
  lacp                 Link Aggregation Control Protocol
  list                 Print command list
  log                  Logging control
  mac                  Global MAC configuration subcommands
  mac-address-table    mac address table
  mirror               Port mirroring
  no                   Negate a command or set its defaults
  ntp                  Configure NTP
  password             Assign the terminal connection password
  qos                  Quality of Service (QoS)
  relay                relay output type information
  smtp-server          SMTP server configuration
  snmp-server          SNMP server
  spanning-tree        spanning tree algorithm
  super-ring           super-ring protocol
  trunk                Trunk group configuration
  vlan                 Virtual LAN
  warning-event        Warning event selection
  write-config         Specify config files to write to
```

(Port) Interface Configuration: Press **interface IFNAME** in global configuration mode. You can then enter interface configuration mode. In this mode, you can configure port settings.

The port interface name for gigabit Ethernet port 1~9 are gi1~gi9. Typing in the interface name accordingly when you want to enter certain interface configuration mode.

Type "**exit"** to leave this current level.

Type "**?** " to show the command list

Available command lists of the global configuration mode.

```
Switch(config)# interface gi1
Switch(config-if)#
  acceptable          Configure 802.1Q acceptable frame types of a port.
  auto-negotiation    Enable auto-negotiation state of a given port
  description         Interface specific description
  duplex              Specify duplex mode of operation for a port
  end                 End current mode and change to enable mode
  exit                Exit current mode and down to previous mode
  flowcontrol         Set flow-control value for an interface
  garp                General Attribute Registration Protocol
  ingress             802.1Q ingress filtering features
  lacp                Link Aggregation Control Protocol
  list                Print command list
  loopback            Specify loopback mode of operation for a port
  mac                 MAC interface commands
  mdix                Enable mdix state of a given port
  no                  Negate a command or set its defaults
  qos                 Quality of Service (QoS)
  quit                Exit current mode and down to previous mode
  rate-limit          Rate limit configuration
  shutdown            Shutdown the selected interface
  spanning-tree       spanning-tree protocol
  speed               Specify the speed of a Fast Ethernet port or a Gigabit
Ethernet port.
  switchport          Set switching mode characteristics
```

(VLAN) Interface Configuration: Press **interface VLAN VLAN-ID** in global configuration mode. You can then enter VLAN interface configuration mode. In this mode, you can configure the settings for the specific VLAN.

The VLAN interface name of VLAN 1 is VLAN 1, VLAN 2 is VLAN 2…

Type **exit** to leave the mode. Type **?** to see the available command list.

The command lists of the VLAN interface configuration mode.

```
Switch(config)# interface vlan 1
Switch(config-if)#
  description   Interface specific description
  end           End current mode and change to enable mode
  exit          Exit current mode and down to previous mode
  ip            Interface Internet Protocol config commands
  list          Print command list
  no            Negate a command or set its defaults
  quit          Exit current mode and down to previous mode
  shutdown      Shutdown the selected interface
```

Summary of the 5 command modes.

Command Mode	**Main Function**	**Enter and Exit Method**	**Prompt**
User EXEC	This is the first level of access. User can ping, telnet remote device, and show some basic information	Enter: **Login** successfully Exit: **exit** to logout. Next mode: Type "**enable"** to enter privileged EXEC mode.	Switch>
Privileged EXEC	In this mode, the system allows you to view current configuration, reset default, reload switch, show system information, save configuration…and enter global configuration mode.	Enter: Type "**enable"** in User EXEC mode. Exec: Type "**disable"** to exit to user EXEC mode. Type "**exit"** to logout Next Mode: Type "**configure terminal"** to enter global configuration command.	Switch#
Global configuration	In global configuration mode, you can configure all the features that the system provides you	Enter: Type **configure terminal** in privileged EXEC mode Exit: Type **exit** or **end** or press **Ctrl-Z** to exit. Next mode: Type **interface IFNAME/ VLAN VID** to enter interface configuration mode	Switch(config)#
Port Interface configuration	In this mode, you can configure port related settings.	Enter: Type **interface IFNAME** in global configuration mode. Exit: Type **exit** or **Ctrl+Z** to global configuration mode. Type **end** to privileged EXEC mode.	Switch(config-if)#
VLAN Interface Configuration	In this mode, you can configure settings for specific VLAN.	Enter: Type **interface VLAN VID** in global configuration mode. Exit: Type **exit** or **Ctrl+Z** to global configuration mode. Type **end** to privileged EXEC mode.	Switch(config-vlan)#

Here are some useful commands for you to see these available commands. Save your time in typing and avoid typing error.

? To see all the available commands in this mode. It helps you to see the next command you can/should type as well.

```
Switch(config)# interface ?
  IFNAME   Interface's name
  vlan     Select a vlan to configure
```

(Character) ? To see all the available commands starts from this character.

```
Switch(config)# a?
  access-list      Add an access list entry
  administrator    Administrator account setting
  arp              Set a static ARP entry
```

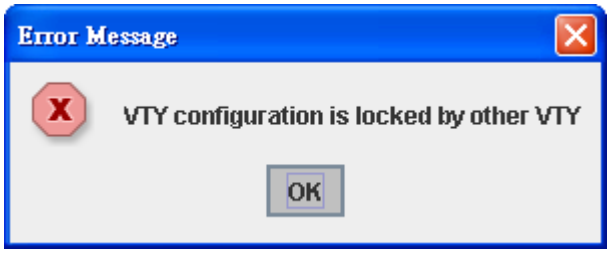
Tab This tab key helps you to input the command quicker. If there is only one available command in the next, clicking on tab key can help to finish typing soon.

```
Switch# co (tab) (tab)
Switch# configure terminal

Switch(config)# ac (tab)
Switch(config)# access-list
```

Ctrl+C To stop executing the unfinished command.
Ctrl+S To lock the screen of the terminal. You can't input any command.
Ctrl+Q To unlock the screen which is locked by Ctrl+S.
Ctrl+Z To exit configuration mode.

Alert message when multiple users want to configure the switch. If the administrator is in configuration mode, then the Web users can't change the settings. The management Switch allows only one administrator to configure the switch at same time.



4.2 Basic Setting

The Basic Setting group provides you to configure switch information, IP address, User's name/Password of the system. It also allows you to do firmware upgrade, backup and restore configuration, reload factory default, and reboot the system.

Following commands are included in this group:

4.2.1 Switch Setting

4.2.2 Admin Password

4.2.3 IP Configuration

4.2.4 Time Setting

4.2.5 DHCP Server

4.2.6 Backup and Restore

4.2.7 Firmware Upgrade

4.2.8 Factory Default

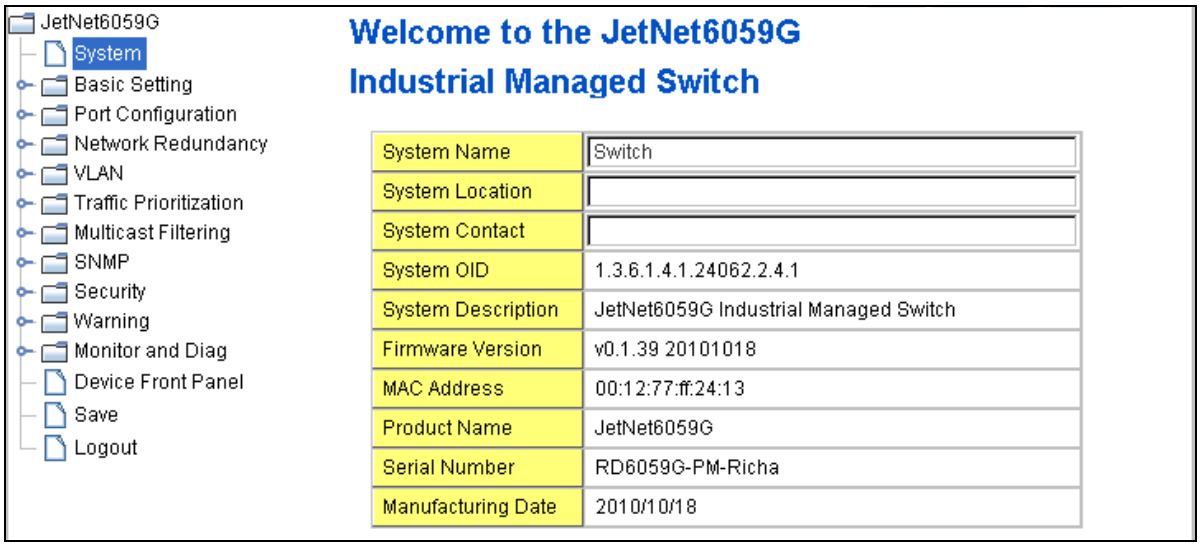
4.2.9 System Reboot

4.2.10 CLI Commands for Basic Setting

4.2.1 Switch Setting

You can assign System name, Location, Contact and view system information.

Figure 4.2.1.1 – Web UI of the Switch Setting



System Name: You can assign a name to the device. The available characters you can input is 64. After you configure the name, CLI system will select the first 12 characters as the name in CLI system.

System Location: You can specify the switch's physical location here. The available characters you can input are 64.

System Contact: You can specify contact people here. You can type the name,

mail address or other information of the administrator. The available characters you can input are 64.

System OID: The SNMP object ID of the switch. You can follow the path to find its private MIB in MIB browser. (**Note:** When you attempt to view private MIB, you should compile private MIB files into your MIB browser first.)

System Description: Industrial Management Ethernet Switch is the name of this product.

Firmware Version: Display the firmware version installed in this device.

MAC Address: Display unique hardware address (MAC address) assigned by the manufacturer.

Product Name: Display the Switch's model name

Serial Number: Display the Switch's serial number

Manufacture Date: Display the switch's production date.

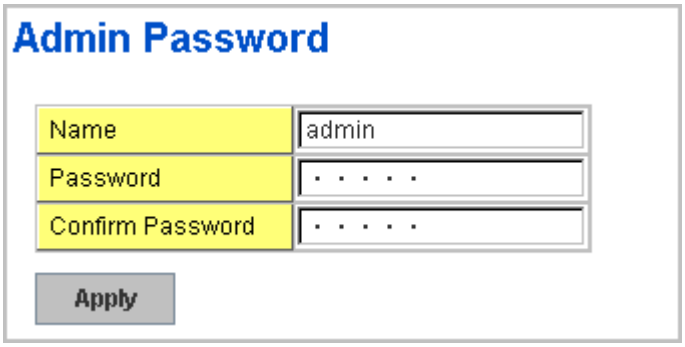
Once you finish the configuration, click on **Apply** to apply your settings.

Note: Always remember to select **Save** to save your settings. Otherwise, the settings you made will be lost when the switch is powered off.

4.2.2 Admin Password

You can change the user name and the password here to enhance security

Figure 4.2.2.1 Web UI of the Admin Password



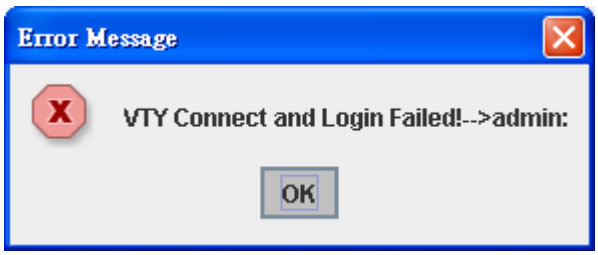
Name: You can key in new user name here. The default setting is **admin**.

Password: You can key in new password here. The default setting is **admin**.

Confirm Password: You need to type the new password again to confirm it.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

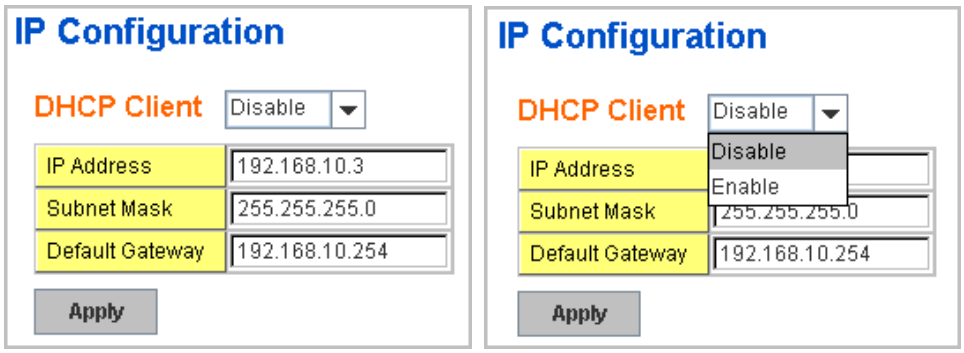
Figure 4.2.2.2 Popup alert window for Incorrect Username.



4.2.3 IP Configuration

This function allows users to configure the switch's IP address settings. The JetNet Switch supports IPv4 and IPv6 dual stack mechanism and able to run IPv4 and IPv6 in parallel and independent of each other to supports graduful migration of endpoints networks, and application. The IP configuration will introduce in separates.

IPv4 Configuration – Static IPv4 address or Dynamic configure by DHCP Server



DHCP Client: You can select to **Enable** or **Disable** DHCP Client function. When DHCP Client function is enabled, an IP address will be assigned to the switch from the network's DHCP server. In this mode, the default IP address will therefore be replaced by the one assigned by DHCP server. If DHCP Client is disabled, then the IP address that you specified will be used instead.

IP Address: You can assign the IP address reserved by your network for your JetNet. If DHCP Client function is enabled, you don't need to assign an IP address to the JetNet, as it will be overwritten by DHCP server and shown here. The default IP is 192.168.10.1.

Subnet Mask: You can assign the subnet mask for the IP address here. If DHCP Client function is enabled, you don't need to assign the subnet mask. The default Subnet Mask is 255.255.255.0.

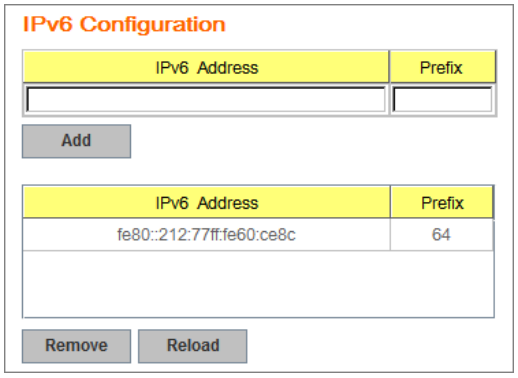
Note: In the CLI, we use the enabled bit of the subnet mask to represent the number displayed in web UI. For example, 8 stands for 255.0.0.0; 16 stands for 255.255.0.0; 24 stands for 255.255.255.0.

Default Gateway: You can assign the gateway for the switch here. The default gateway is 192.168.10.254.

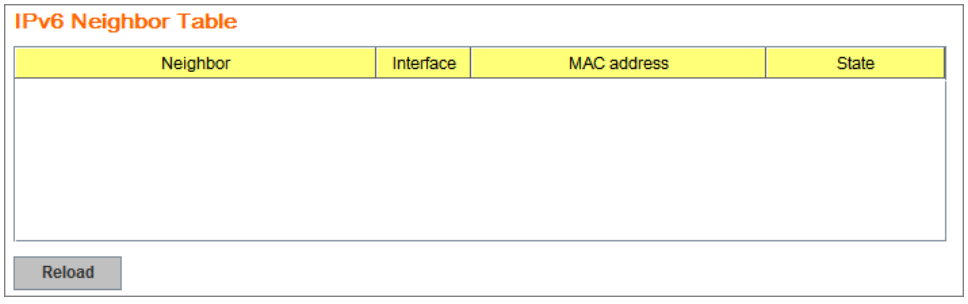
Note: In CLI, we use 0.0.0.0/0 to represent for the default gateway.

Once you finish the configuration, please click on **Apply** to apply your setting into system.

IPv6 Configuration –An IPv6 address is represented as eight groups of four hexadecimal digits, each group representing 16 bits (two octets). The groups are separated by colons (:), and the length of IPv6 address is 128bits.
An example of an IPv6 address is: 2001:0db8:85a3:0000:0000:8a2e:0370:7334. The default IP address of JetNet Managed Switch is fe80:0:0:0:212:77ff:fe60:ce8c, and the Leading zeroes in a group may be omitted. Thus, the example address may be written as: fe80::212:77ff:fe60:ce8c.



IPv6 Address field: typing new IPv6 address in this field.
Prefix: the size of subnet or netwok, and it equivalent to the subnetmask, but written in different. The default subnet mask length is 64bits, and writen in decimal value - 64.
Add: after add new IPv6 address and prefix, don't forget click icon -"**Add**" to apply new address to system.
Remove: select existed IPv6 address and click icon -"**Remove**" to delete IP address.
Reload: refresh and reload IPv6 address listing.
IPv6 Neighbor Table: shows the IPv6 address of neighbor, connected interface, MAC address of remote IPv6 device, and current state of neighbor device.



The system will update IPv6 Neighbor Table automatically, and user also can click the icon "**Reload**" to refresh the tabale.

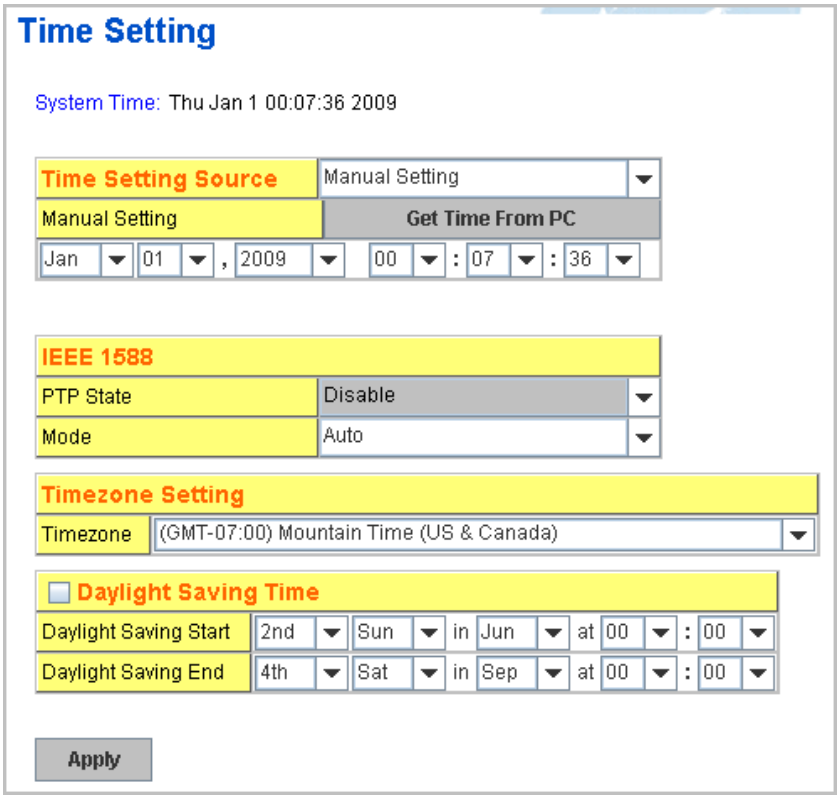
4.2.4 Time Setting

Time Setting source allow user to set the time manually or through NTP server. Network Time Protocol (NTP) is used to synchronize computer clocks on the internet. You can configure NTP settings here to synchronize the clocks of several switches on the network.

The IEEE1588 PTP (Precision Time Protocol) supports very precise time synchronization in an Ethernet network. There are two clocks, Master and Slave. The master device periodically launches an exchange of messages with slave devices to help each slave clock re-compute the offset between its clock and the master's clock.

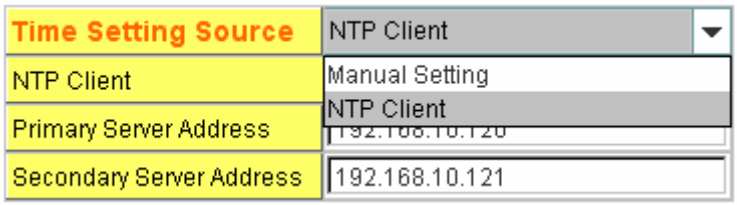
*Note: Please enable one synchronization protocol (PTP/NTP) only.

The Switch also provides Daylight Saving function for some territories use.



Manual Setting: User can select Manual setting to change time as user wants. User also can click the button "**Get Time from PC**" to get PC's time setting for switch.

NTP client: Select the Time Setting Source to **NTP client** can let device enable the NTP client service. NTP client will be automatically enabled if you change Time source to NTP Client. The system will send request packet to acquire current time from the NTP server you assigned.

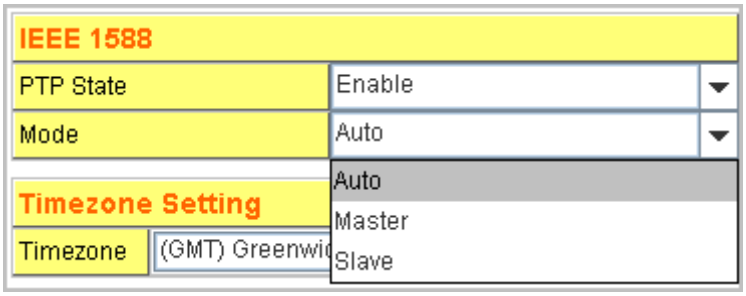


IEEE 1588: select the **PTP State** to enable this function and select one operating mode for the precision time synchronizes.

Auto mode: the switch performs PTP Master and slave mode (Bindary mode)

Master mode: switch performs PTP Master only.

Slave mode: switch performs PTP slave only.



Time-zone: Select the time zone where the switch is located. Following table lists the time zones for different locations for your reference. The default time zone is GMT Greenwich Mean Time.

Switch(config)# clock timezone
- 01 (GMT-12:00) Eniwetok, Kwajalein
- 02 (GMT-11:00) Midway Island, Samoa
- 03 (GMT-10:00) Hawaii
- 04 (GMT-09:00) Alaska
- 05 (GMT-08:00) Pacific Time (US & Canada) , Tijuana
- 06 (GMT-07:00) Arizona
- 07 (GMT-07:00) Mountain Time (US & Canada)
- 08 (GMT-06:00) Central America
- 09 (GMT-06:00) Central Time (US & Canada)
- 10 (GMT-06:00) Mexico City
- 11 (GMT-06:00) Saskatchewan
- 12 (GMT-05:00) Bogota, Lima, Quito
- 13 (GMT-05:00) Eastern Time (US & Canada)
- 14 (GMT-05:00) Indiana (East)
- 15 (GMT-04:00) Atlantic Time (Canada)
- 16 (GMT-04:00) Caracas, La Paz
- 17 (GMT-04:00) Santiago
- 18 (GMT-03:00) NewFoundland
- 19 (GMT-03:00) Brasilia
- 20 (GMT-03:00) Buenos Aires, Georgetown
- 21 (GMT-03:00) Greenland
- 22 (GMT-02:00) Mid-Atlantic
- 23 (GMT-01:00) Azores

24 (GMT-01:00) Cape Verde Is.
25 (GMT) Casablanca, Monrovia
26 (GMT) Greenwich Mean Time: Dublin, Edinburgh, Lisbon, London
27 (GMT+01:00) Amsterdam, Berlin, Bern, Rome, Stockholm, Vienna
28 (GMT+01:00) Belgrade, Bratislava, Budapest, Ljubljana, Prague
29 (GMT+01:00) Brussels, Copenhagen, Madrid, Paris
30 (GMT+01:00) Sarajevo, Skopje, Sofija, Vilnius, Warsaw, Zagreb
31 (GMT+01:00) West Central Africa
32 (GMT+02:00) Athens, Istanbul, Minsk

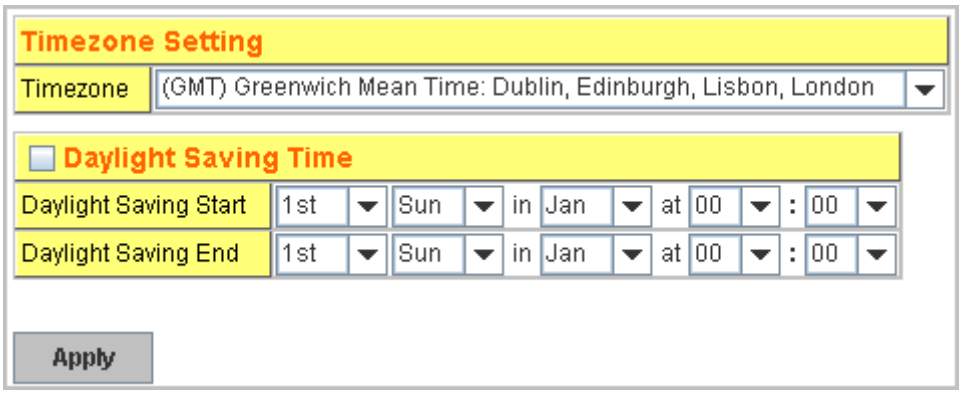
49 (GMT+05:45) Kathmandu
50 (GMT+06:00) Almaty, Novosibirsk
51 (GMT+06:00) Astana, Dhaka
52 (GMT+06:00) Sri Jayawardenepura
53 (GMT+06:30) Rangoon
54 (GMT+07:00) Bangkok, Hanoi, Jakarta
55 (GMT+07:00) Krasnoyarsk
56 (GMT+08:00) Beijing, Chongqing, Hong Kong, Urumqi
57 (GMT+08:00) Irkutsk, Ulaan Bataar
58 (GMT+08:00) Kuala Lumpur, Singapore
59 (GMT+08:00) Perth
60 (GMT+08:00) Taipei
61 (GMT+09:00) Osaka, Sapporo, Tokyo
62 (GMT+09:00) Seoul
63 (GMT+09:00) Yakutsk
64 (GMT+09:30) Adelaide
65 (GMT+09:30) Darwin
66 (GMT+10:00) Brisbane
67 (GMT+10:00) Canberra, Melbourne, Sydney
68 (GMT+10:00) Guam, Port Moresby
69 (GMT+10:00) Hobart
70 (GMT+10:00) Vladivostok
71 (GMT+11:00) Magadan, Solomon Is., New Caledonia
72 (GMT+12:00) Aukland, Wellington
73 (GMT+12:00) Fiji, Kamchatka, Marshall Is.
74 (GMT+13:00) Nuku'alofa

Daylight Saving Time: click the check box to enable the Daylight Saving Function as the setting of start and end time or disable it.

Daylight Saving Start and **Daylight Saving End:** the time setting allows user to selects the week that monthly basis, and sets the End and Start time individually.



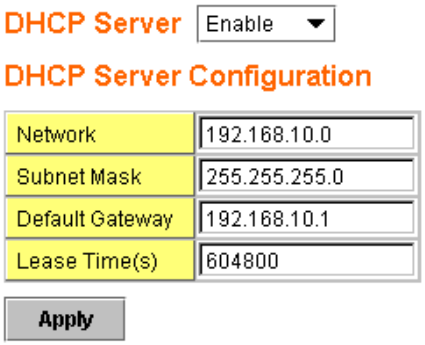
Once you finish those configurations, click on **Apply** to apply your configuration.

4.2.5 DHCP Server

You can select to **Enable** or **Disable** DHCP Server function. The Managed Switch will assign a new IP address to link partners, and also supports DHCP server option 82 with forwarding policy, and provides port-based DHCP server with IP address binding feature.

DHCP Server configuration

After selecting to enable DHCP Server function, type in the Network IP address for the DHCP server IP pool, Subnet Mask, Default Gateway address and Lease Time for client.

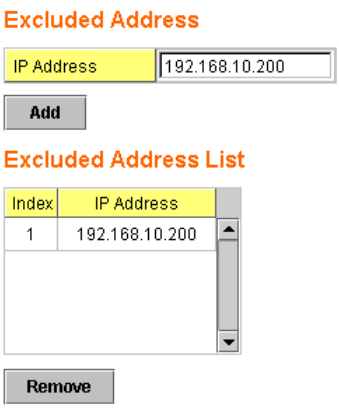


Once you have finished the configuration, click **Apply** to apply your configuration

Excluded Address:

You can type a specific address into the **IP Address field** for the DHCP server reserved IP address.

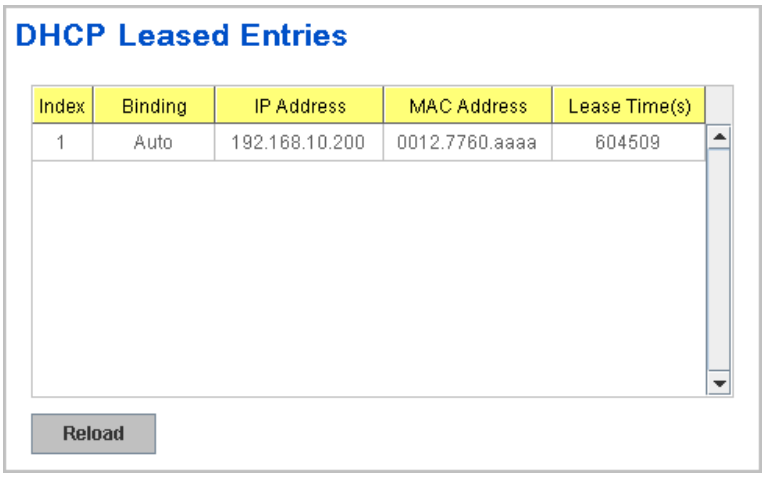
The IP address that is listed in the **Excluded Address List Table** will not be assigned to the



network device. Add or remove an IP address from the **Excluded Address List** by clicking **Add** or **Remove**.

Manual Binding: the Managed Switch provides a MAC address and IP address binding and removing function. You can type in the specified IP and MAC address, and then click **Add** to add a new MAC&IP address binding rule for a specified link partner, like PLC or any device without **DHCP client** function. To remove from the binding list, just select the rule to remove and click **Remove**.

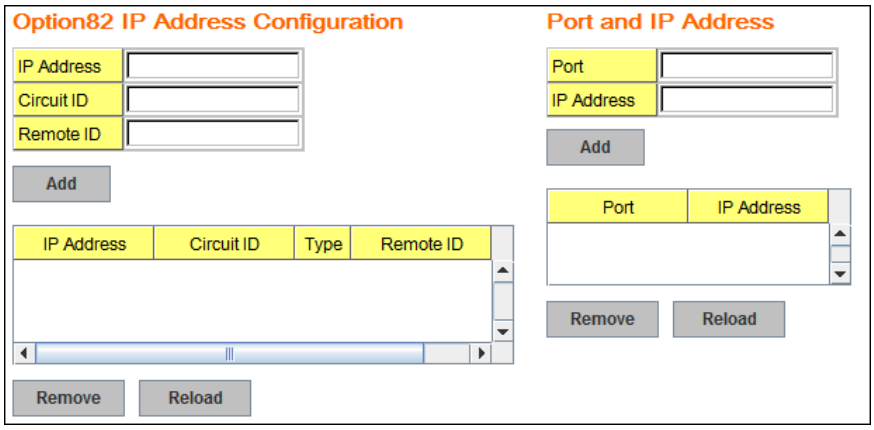
DHCP Leased Entries: the Managed Switch provides an assigned IP address list for user check. It will show the MAC and IP address that was assigned by *Switch*. Click the **Reload** button to refresh the listing.



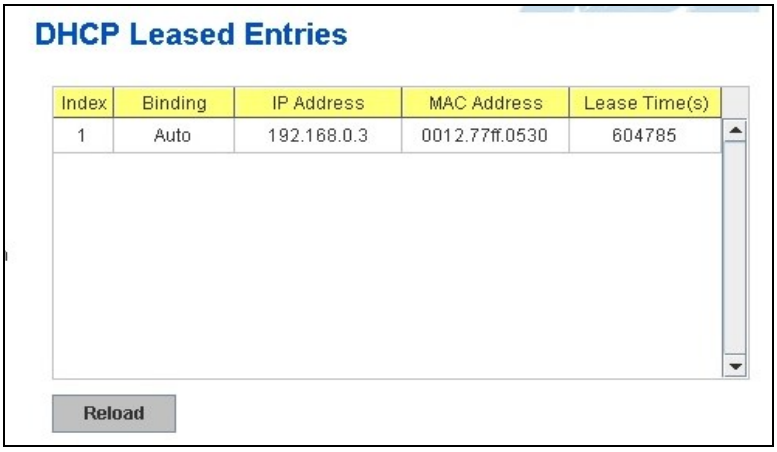
Option 82 IP Address Configuration: the DHCP server with option 82 function presented in firmware V1.1 after. This feature support fully DHCP relay function, and allows user to confgirue relay circuit ID, Remote ID to compliant fully DHCP option 82 function.

Port and IP Address (Port Based DHCP Server configuration): after firmware version v1.2, the Switch support port-based DHCP server function. It

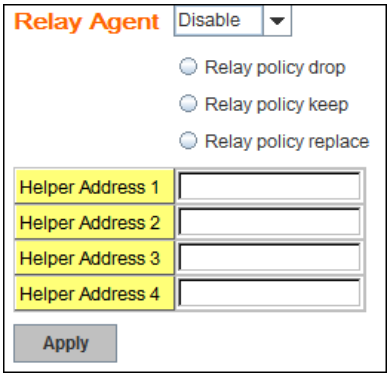
allows user assign specified IP address to specified port that DHCP client presented; and the DHCP server only offer the predefined IP address to the DHCP client.

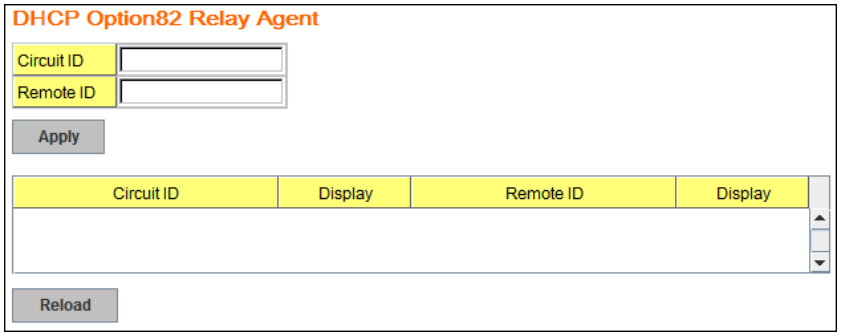


DHCP Leased Entries: the Managed Switch provides an assigned IP address list for user check. It will show the MAC and IP address that was assigned by **Managed Switch**. Click the **Reload** button to refresh the listing.



DHCP Relay Agent
You can select to **Enable** or **Disable** DHCP relay agent function, and then select the modification type of option 82 field, circuit ID, remote ID.





Relay policy drop: Drops the option 82 field and do not add any option 82 field information into the packet.

Relay policy keep: Keeps the original option 82 field and forwards packet to DHCP server.

Relay policy replace: Replaces the existing option 82 field and adds new value into DHCP option 82 field. (This is the default setting)

Helper Address: there are 4 fields for the DHCP server's IP address. You can filll the field with prefered IP address of DHCP Server, and then click "Apply" to activate the DHCP relay agent function. All the DHCP packets from client will be modified by the policy and forwarded to DHCP server through the gateway port.

4.2.6 Backup and Restore

With Backup command, you can save current configuration file saved in the switch's flash to admin PC or TFTP server. This will allow you to go to **Restore** command later to restore the configuration file back to the switch. Before you restore the configuration file, you must place the backup configuration file in the PC or TFTP server. The switch will then download this file back to the flash.

There are 2 modes for users to backup/restore the configuration file, Local File mode and TFTP Server mode.

Local File mode: In this mode, the switch acts as the file server. Users can browse the target folder and then type the file name to backup the configuration. Users can also browse the target folder and select existed configuration file to restore the configuration back to the switch. This mode is only provided by Web UI while CLI is not supported.

TFTP Server mode: In this mode, the switch acts as TFTP client. Before you do so, make sure that your TFTP server is ready. Then please type the IP address of TFTP Server and Backup configuration file name. This mode can be used in both CLI and Web UI.

TFTP Server IP Address: You need to key in the IP address of your TFTP Server here.

Backup/Restore File Name: Please type the correct file name of the configuration file..

Configuration File: The configuration file of the switch is a pure text file. You can open it by word/txt read file. You can also modify the file, add/remove the configuration settings, and then restore back to the switch.

Startup Configuration File: After you saved the running-config to flash, the new settings will be kept and work after power cycle. You can use *show startup-config* to view it in CLI. The Backup command can only backup such configuration file to your PC or TFTP server.

Technical Tip:

Default Configuration File: *The switch provides the default configuration file in the system. You can use Reset button, Reload command to reset the system.*

Running Configuration File: *The switch's CLI allows you to view the latest settings running by the system. The information shown here is the settings you set up but haven't saved to flash. The settings not yet saved to flash will not work after power recycle. You can* use *show running-config* to view it in CLI.

Figure 4.2.6.1 Main UI of Backup & Restore

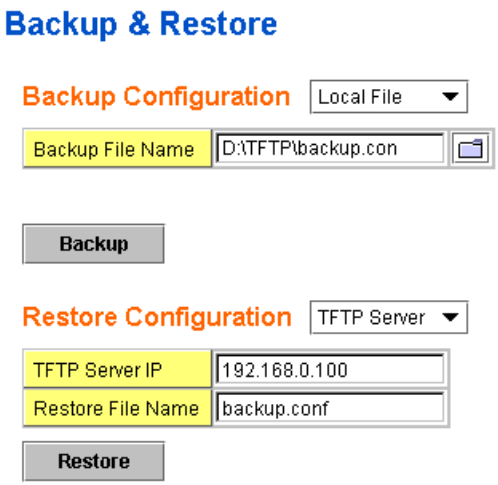


Figure 4.2.6.2 Bacup/Restore Configuration - Local File mode.

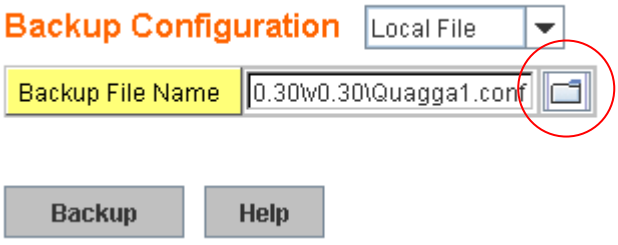
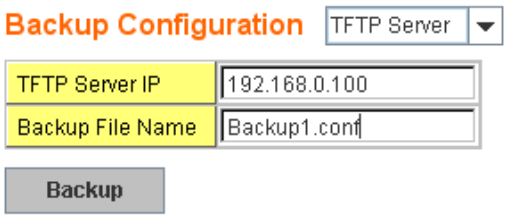


Click on Folder icon  to select the target file you want to backup/restore.

Note that the folders of the path to the target file do not allow you to input space key.

Figure 4.2.6.3 Backup/Restore Configuration - TFTP Server mode



Type the IP address of TFTP Server IP. Then click on **Backup/Restore**.
Note: point to the wrong file will cause the entire configuration missed

4.2.7 Firmware Upgrade

In this section, you can update the latest firmware for your switch, and also get latest version firmware from service Web site. The new firmware may include new features, bug fixes or other software changes. We'll also provide the release notes for the update as well. For technical viewpoint, we suggest you use the latest firmware before installing the switch to the customer site.

Note that the system will be automatically rebooted after you finished upgrading new firmware. Please remind the attached users before you do this.

Figure 4.2.7.1 Main UI of Firmware Upgrade

There are 2 modes for users to backup/restore the configuration file, **Local File** mode and **TFTP Server** mode.

Local File mode: In this mode, the switch acts as the file server. Users can browse the target folder and then type the file name to backup the configuration. Users also can browse the target folder and select the existed configuration file to restore the configuration back to the switch. This mode is only provided by Web UI while CLI is not supported.

TFTP Server mode: In this mode, the switch acts as the TFTP client. Before you do so, make sure that your TFTP server is ready. And then please type the IP address of TFTP Server IP address. This mode can be used in both CLI and Web UI.

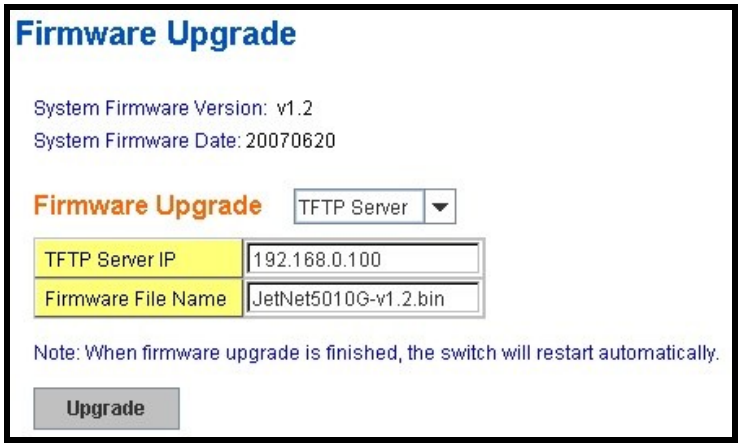
TFTP Server IP Address: You need to key in the IP address of your TFTP Server here.

Firmware File Name: The file name of the new firmware.
The UI also shows you the current firmware version and built date of current firmware. Please check the version number after the switch is rebooted.

Figure 4.2.7.2 Firmware Upgrade - Local File mode.

 Click on Folder icon to select the target firmware file you want to upgrade.

Figure 4.2.7.3 Firmware Upgrade – TFTP Server mode.



Type the IP address of TFTP Server and Firmware File Name. Then click on **Upgrade** to start the process.

After finishing transmitting the firmware, the system will copy the firmware file and replace the firmware in the flash. The CLI show …… until the process is finished.

4.2.8 Factory Default

In this section, you can reset all the configurations of the switch to default setting. Click on **Reset** the system will then reset all configurations to default setting. The system will show you popup message window after finishing this command. Default setting will work after rebooting the switch.

Figure- 4.2.8.1 The main screen of the Reset to Default

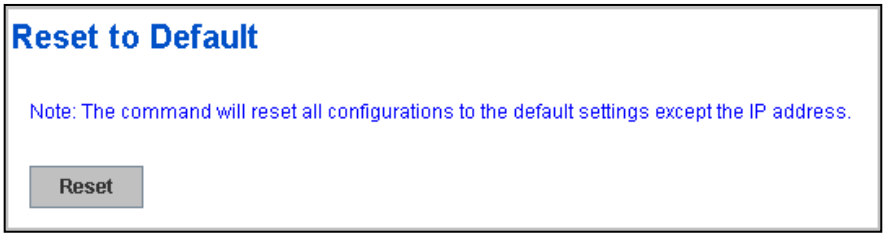


Figure 4.2.8.2 Popup alert screen to confirm the command. Click on **Yes** to start it.

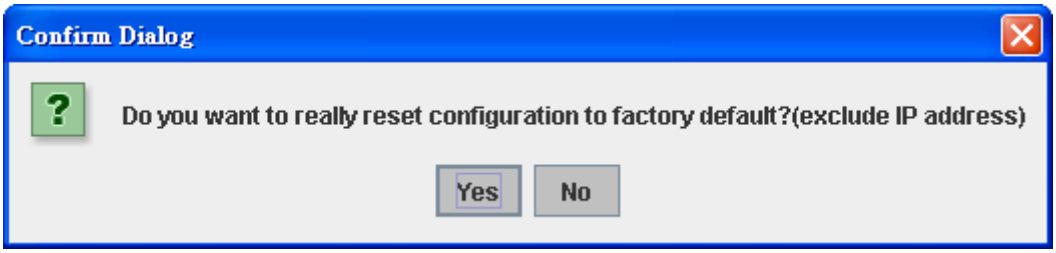

Figure 4.2.8.3 Popup message screen to show you that have done the command. Click on **OK** to close the screen. Then please go to **Reboot** page to reboot the switch.

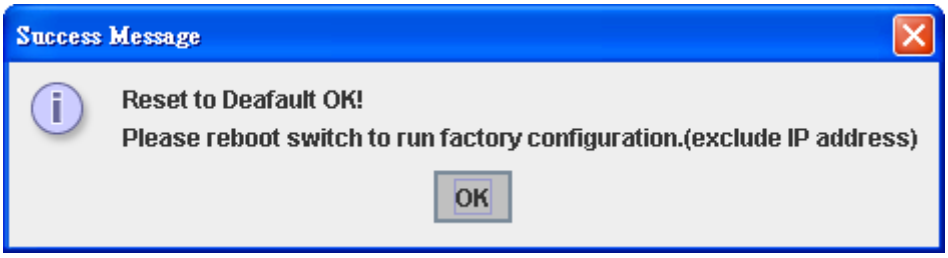

Click on **OK.** The system will then auto reboot the device.

Note: If you already configured the IP of your device to other IP address, when you use this command by CLI and Web UI, our software will not reset the IP address to default IP. The system will remain the IP address so that you can still connect the switch via the network.

4.2.9 System Reboot

System Reboot allows you to reboot the device. Some of the feature changes require you to reboot the system. Click on **Reboot** to reboot your device.

Note: *Remember to click on* ***Save*** *button to save your settings. Otherwise, the settings you made will be gone when the switch is powered off.*

Figure 4.2.9.1 Main screen for Rebooting

Figure 4.2.9.2 Pop-up alert screen to request confirmation. Click on **Yes**. Then the switch will be rebooted immediately.

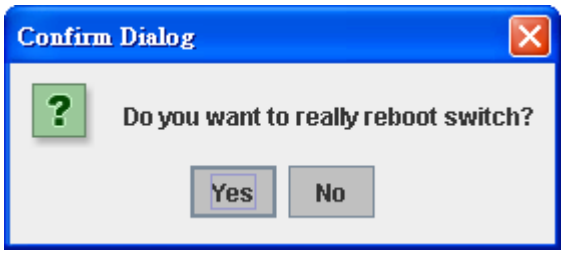

Figure 4.2.9.3 Pop-up message screen appears when rebooting the switch.

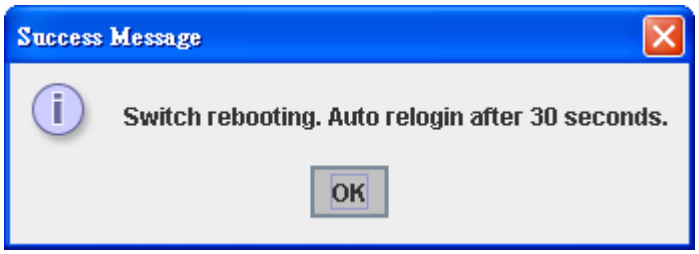

4.2.10 CLI Commands for Basic Setting

Feature	Command Line

4.3 Port Configuration

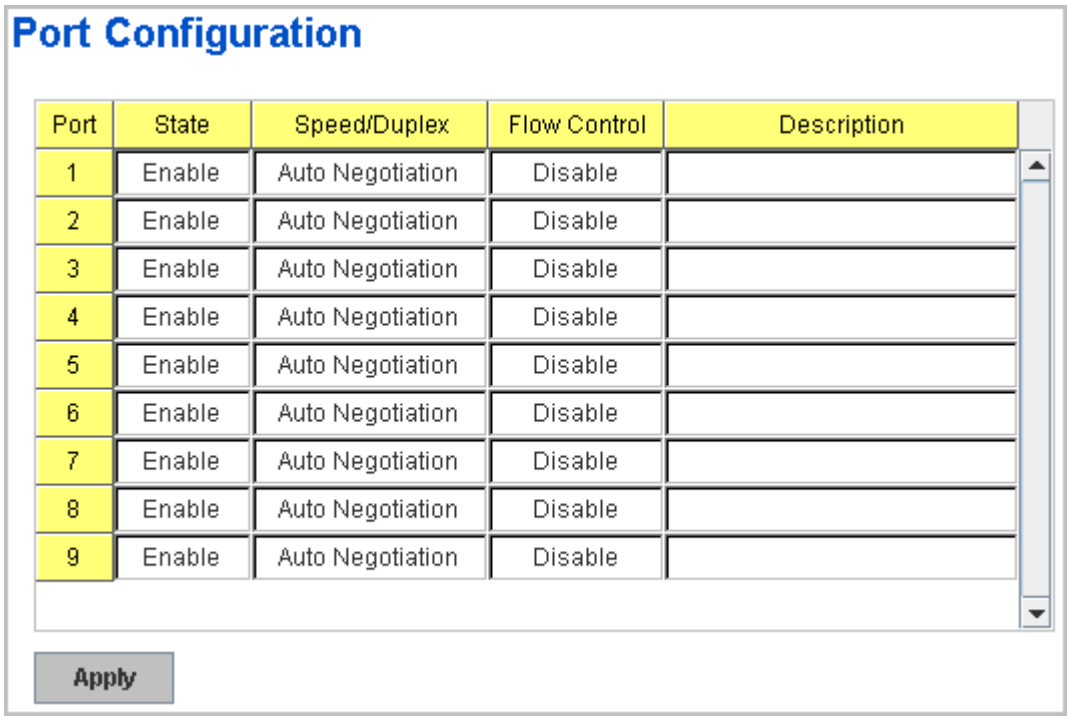
Port Configuration group enables you to enable/disable port state, or configure port auto-negotiation, speed, and duplex, flow control, rate limit control and port aggregation settings. It also allows you to view port status and aggregation information.

Following commands are included in this group:

4.3.1 Port Control
4.3.2 Port Status
4.3.3 Rate Control
4.3.4 Port Trunking
4.3.5 Command Lines for Port Configuration

4.3.1 Port Control

Port Control commands allow you to enable/disable port state, or configure the port auto-negotiation, speed, duplex and flow control.



Select the port you want to configure and make changes to the port.

In **State** column, you can enable or disable the state of this port. Once you disable, the port stop to link to the other end and stop to forward any traffic. The default setting is Enable which means all the ports are workable when you receive the device.

In **Speed/Duplex** column, you can configure port speed and duplex mode

of this port. Below are the selections you can choose:

Gigabit Ethernet Port 1~9: (gi1~gi9) : AutoNegotiation, 10M Full Duplex(10 Full), 10M Half Duplex(10 Half), 100M Full Duplex(100 Full), 100M Half Duplex(100 Half), 1000M Full Duplex(1000 Full), 1000M Half Duplex(1000 Half).

The default mode is Auto Negotiation mode.

In **Flow Control** column, “Symmetric” means that you need to activate the flow control function of the remote network device in order to let the flow control of that corresponding port on the switch to work. “Disable” means that you don’t need to activate the flow control function of the remote network device, as the flow control of that corresponding port on the switch will work anyway.

Once you finish configuring the settings, click on **Apply** to save the configuration.

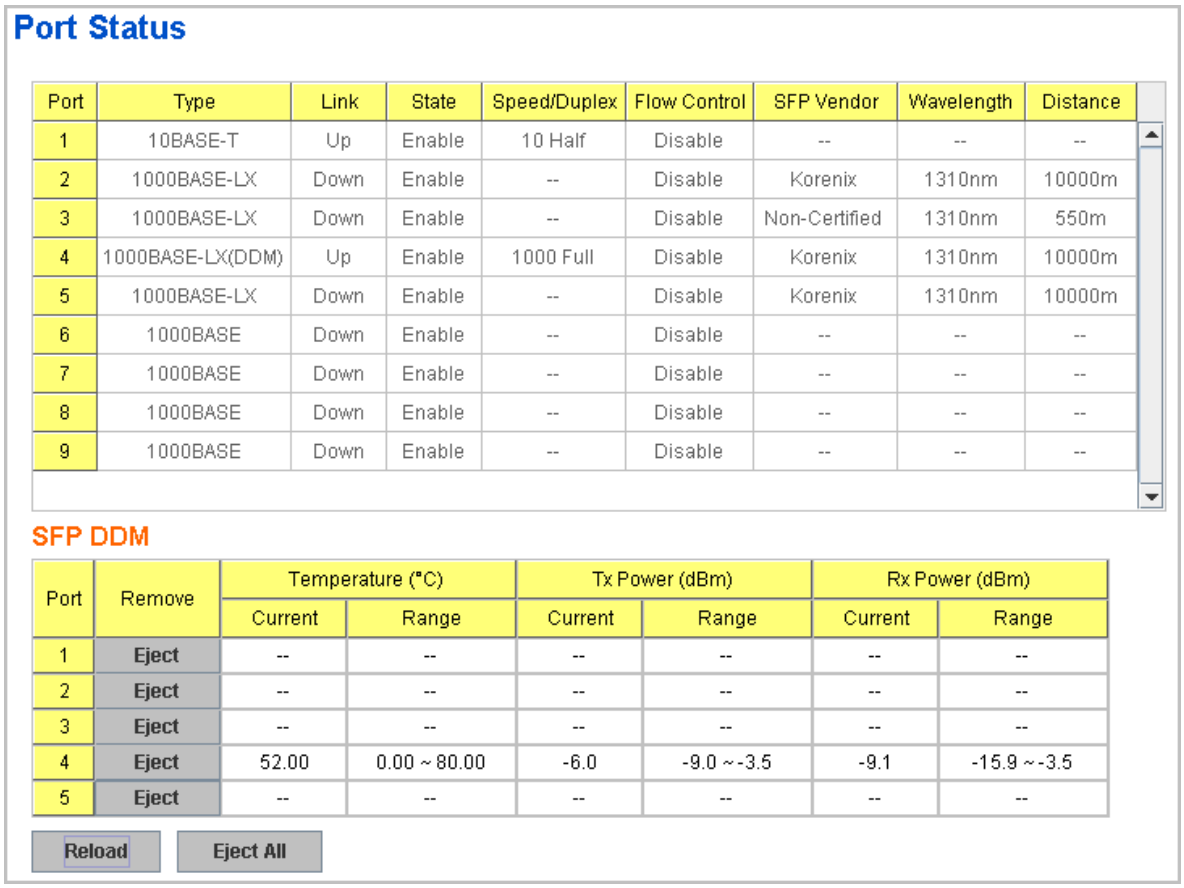
Technical Tips: *If both ends are not at the same speed, they can’t link with each other. If both ends are not in the same duplex mode, they will be connected by half mode.*

4.3.2 Port Status

Port Status shows you current port status.

In the firmware version 2.2, it supports Small Form Factory (SFP) fiber transceiver with Digital Diagnostic Monitoring (DDM) function that provides real time information of SFP transceiver and allows user to diagnostic the optical fiber signal received and launched.

The information of SFP DDM will listing by SDP DDM table as following:



Port Status

Port	Type	Link	State	Speed/Duplex	Flow Control	SFP Vendor	Wavelength	Distance
1	10BASE-T	Up	Enable	10 Half	Disable	--	--	--
2	1000BASE-LX	Down	Enable	--	Disable	Korenix	1310nm	10000m
3	1000BASE-LX	Down	Enable	--	Disable	Non-Certified	1310nm	550m
4	1000BASE-LX(DDM)	Up	Enable	1000 Full	Disable	Korenix	1310nm	10000m
5	1000BASE-LX	Down	Enable	--	Disable	Korenix	1310nm	10000m
6	1000BASE	Down	Enable	--	Disable	--	--	--
7	1000BASE	Down	Enable	--	Disable	--	--	--
8	1000BASE	Down	Enable	--	Disable	--	--	--
9	1000BASE	Down	Enable	--	Disable	--	--	--

SFP DDM

Port	Remove	Temperature (°C)		Tx Power (dBm)		Rx Power (dBm)	
		Current	Range	Current	Range	Current	Range
1	Eject	--	--	--	--	--	--
2	Eject	--	--	--	--	--	--
3	Eject	--	--	--	--	--	--
4	Eject	52.00	0.00 ~ 80.00	-6.0	-9.0 ~ -3.5	-9.1	-15.9 ~ -3.5
5	Eject	--	--	--	--	--	--

Reload | Eject All

The description of the columns is as below:

Port: Port interface number.

Type: 100TX -> Fast Ethernet port. 1000TX -> Gigabit Ethernet port.

Link: Link status. Up -> Link UP. Down -> Link Down.

State: Enable -> State is enabled. Disable -> The port is disable/shutdown.

Speed/Duplex: Current working status of the port.

Flow Control: The state of the flow control.

SFP Vendor: Vendor name of the SFP transceiver you plugged.

Wavelength: The wave length of the SFP transceiver you plugged.

Distance: The distance of the SFP transceiver you plugged.

Eject: Eject the DDM SFP transceiver. You can eject one port or eject all by click the icon “Eject All”.

Temperature: The temperature spcific and current detected of DDM SFP transceiver.

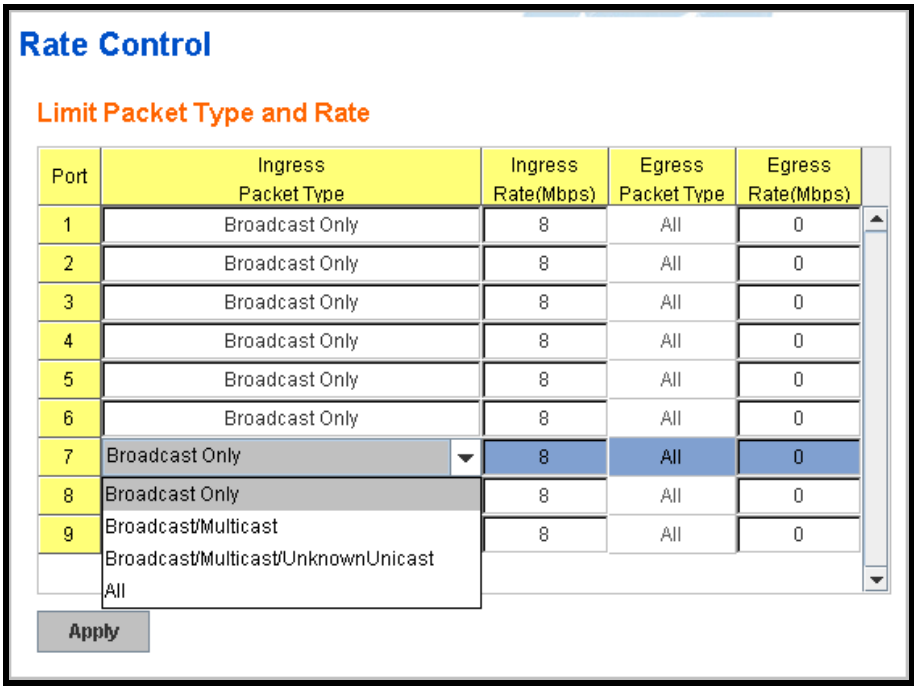
Tx Power (dBm): The specification and current transmit power of DDM SFP transceiver.

Rx Power (dBm): The specification and current received power of DDM SFP transceiver.

Note: 1. Most of the SFP transceivers provide vendor information which allows your switch to read it. The UI can display vendor name, wave length and distance of all Korenix SFP transceiver family. If you see Unknown info, it may mean that the vendor doesn’t provide their information or that the information of their transceiver can’t be read.

2. if the plugged DDM SFP transceiver is not certified by Korenix, the DDM function will not be supported. But the communication will not disable.

4.3.3 Rate Control



Rate limiting is a form of flow control used to enforce a strict bandwidth limit at a port. You can program separate transmit (Egress Rule) and receive (Ingress Rule) rate limits at each port, and even apply the limit to certain packet types as described below.

Packet type: You can select the packet type that you want to filter. The

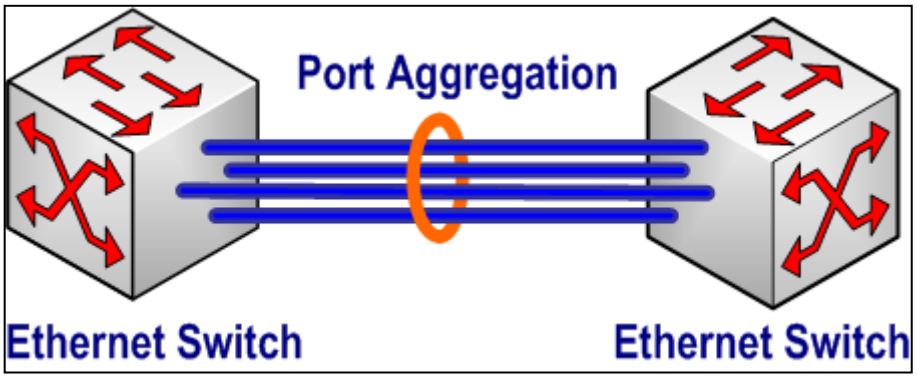
packet types of the Ingress Rule listed here include **Broadcast Only** / **Broadcast and multicast** / **Broadcast, Multicast and Unknown Unicast** or **All**. The packet types of the Egress Rule (outgoing) only support **all** packet types.

Rate: This column allows you to manually assign the limit rate of the port. Valid values are from 1Mbps-100Mbps for fast Ethernet ports and gigabit Ethernet ports. The step of the rate is 1 Mbps. Default value of Ingress Rule is “8” Mbps; default value of Egress Rule is 0 Mbps. 0 stands for disabling the rate control for the port.

Click on **Apply** to apply the configuration.

4.3.4 Port Trunking (Port Aggregation)

Port Trunking configuration allows you to group multiple Ethernet ports in parallel to increase link bandwidth. The aggregated ports can be viewed as one physical port so that the bandwidth is higher than merely one single Ethernet port. The member ports of the same trunk group can balance the loading and backup for each other. Port Trunking feature is usually used when you need higher bandwidth for backbone network. This is an inexpensive way for you to transfer more data.

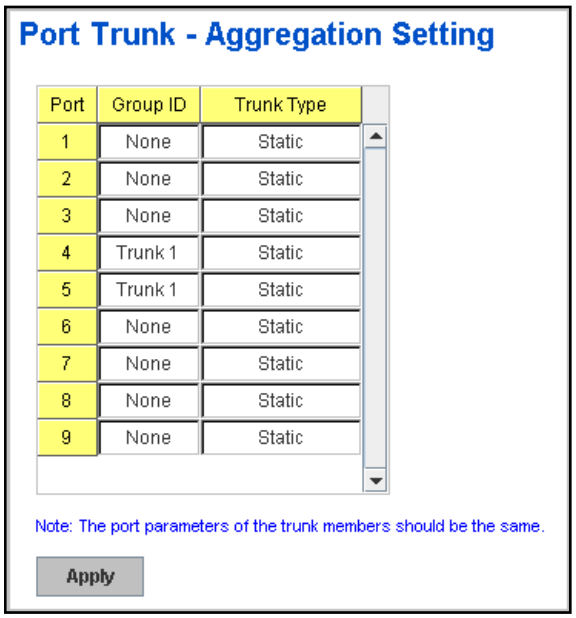


There are some different descriptions for the port trunking. Different manufacturers may use different descriptions for their products, like Link Aggregation Group (LAG), Link Aggregation Control Protocol, Ethernet Trunk, Ether Channel…etc. Most of the implementations now conform to IEEE standard, 802.3ad.

The aggregated ports can interconnect to the other switch which also supports Port Trunking. Korenix Supports 2 types of port trunking. One is Static Trunk, the other is 802.3ad. When the other end uses 802.3ad LACP, you **should** assign 802.3ad LACP to the trunk. When the other end uses non-802.3ad, you can then use Static Trunk.

There are 2 configuration pages, Aggregation Setting and Aggregation Status.

Aggregation Setting



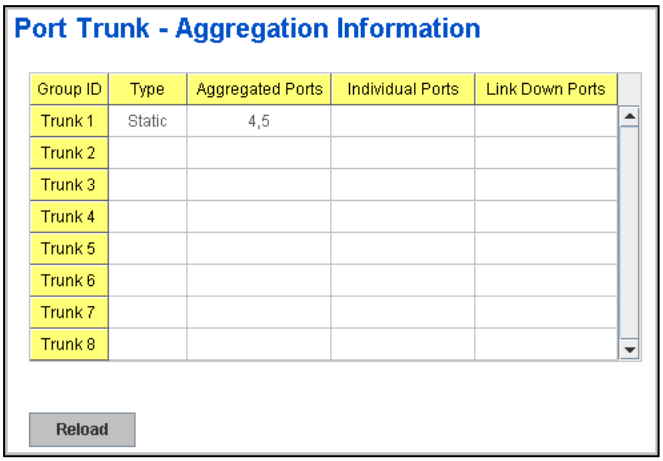
Trunk Size: The switch can support up to 4 trunk groups. Each trunk group can support up to 8 member ports. The member ports should use same speed and link duplex mode.

Group ID: Group ID is the ID for the port trunking group. Ports with same group ID are in the same group.

Type: Static and **802.3ad LACP.** Each Trunk Group can only support Static or 802.3ad LACP. Choose the type you need here.

Aggregation Status

This page shows the status of port aggregation. Once the aggregation ports are negotiated well, you will see following status.



Group ID: Display Trunk 1 to Trunk 5 set up in Aggregation Setting.

Type: Static or LACP set up in Aggregation Setting.

Aggregated: When LACP links well, you can see the member ports in aggregated column.

Individual: When port aggregation is enabled, member ports of LACP group which are not connected to correct LACP member ports will be displayed in the Individual column.

Link Down: When port aggregation is enabled, member port of aggregated group which is not linked up will be displayed in the Link Down column.

Extended commands for advanced LACP function in Command Line mode (New LACP feature supported in the firmware V1.1)

Port Priority: The command allows you to change the port priority setting of the specific port. LACP port priority is configured on each port using LACP. The port priority can be configured through the CLI. The higher number will with lower LACP port priority. The default value is 32768.

LACP Timeout: The LACPDU is generated and continue transmit within the LACP group. The interval time of the LACPDU Long timeout is 30 sec, this is default setting. The LACPDP Short timeout is 1 sec, the command to change from Long to Short is only applied to the CLI, and the web GUI doesn't support this command. Once the LACP port doesn't receive the LACPDP 3 times, that means the port may leave the group without earlier inform or does not detect by the switch, then the port will be removed from the group.

This command can be used when connect the switch by 2-port LACP through not-direct connected or shared media, like the Wireless AP or Hub. The end of the switch may not directly detect the failure; the LACP Short Timeout can detect the LACP group failure earlier within 3 seconds.

4.3.5 Command Lines for Port Configuration

Feature	Command Line
Port Control	
Port Control – State	Switch(config-if)# shutdown -> Disable port state Port1 Link Change to DOWN interface fastethernet1 is shutdown now. Switch(config-if)# no shutdown -> Enable port state Port1 Link Change to DOWN Port1 Link Change to UP interface fastethernet1 is up now. Switch(config-if)# Port1 Link Change to UP Switch(config)# sfp ddm Digital diagnostic and monitoring Switch(config)# sfp ddm Eject Reject DDM SFP Switch(config)# sfp ddm eject → eject SFP DDM transceiver all All DDM interface Example: Switch(config)# sfp ddm eject all DDM SFP on Port 9 normally ejected. DDM SFP on Port 9 normally ejected. All DDM SFP normally ejected. Switch(config)# interface gigabitethernet10 → eject port 10 SFP DDM transceiver. Switch(config-if)# sfp ddm eject DDM SFP on Port 10 normally ejected.
Port Control – Auto Negotiation	Switch(config)# interface fa1 Switch(config-if)# auto-negotiation Auto-negotiation of port 1 is enabled!
Port Control – Force Speed/Duplex	Switch(config-if)# speed 100 Port1 Link Change to DOWN set the speed mode ok! Switch(config-if)# Port1 Link Change to UP Switch(config-if)# duplex full Port1 Link Change to DOWN set the duplex mode ok! Switch(config-if)# Port1 Link Change to UP
Port Control – Flow Control	Switch(config-if)# flowcontrol on Flowcontrol on for port 1 set ok! Switch(config-if)# flowcontrol off Flowcontrol off for port 1 set ok!
Port Status	
Port Status	Switch# show interface gi1 Interface gigaether1 Administrative Status : Enable

	Operating Status : Connected Duplex : Full Speed : 100 Flow Control :off Default Port VLAN ID: 1 Ingress Filtering : Disabled Acceptable Frame Type : All Port Security : Disabled Auto Negotiation : Disable Loopback Mode : None STP Status: forwarding Default CoS Value for untagged packets is 0. Mdix mode is Disable. Medium mode is Copper. Switch# show sfp ddm →show SFP DDM information Port 8 Temperature:N/A Tx power:N/A Rx power:N/A Port 9 Temperature:64.00 C <range :0.0-80.00> Tx power:-6.0 dBm <range : -9.0 - -4.0> Rx power:-30.0 dBm <range: -30.0 - -4.0> Port 10 Temperature:67.00 C <range :0.0-80.00> Tx power:-6.0 dBm <range : -9.0 - -4.0> Rx power:-2.0 dBm <range: -30.0 - -4.0> *Note: Administrative Status -> Port state of the port. Operating status -> Current status of the port. Duplex -> Duplex mode of the port. Speed -> Speed mode of the port. Flow control -> Flow Control status of the port.*
Rate Control	
Rate Control – Ingress or Egress	Switch(config-if)# rate-limit egress Outgoing packets ingress Incoming packets ***Note: To enable rate control, you should select the Ingress or Egress rule first; then assign the packet type and bandwidth.***
Rate Control – Filter Packet Type	Switch(config-if)# rate-limit ingress mode all Limit all frames broadcast Limit Broadcast frames flooded-unicast Limit Broadcast, Multicast and flooded unicast frames multicast Limit Broadcast and Multicast frames Switch(config-if)# rate-limit ingress mode broadcast Set the ingress limit mode broadcast ok.
Rate Control - Bandwidth	Switch(config-if)# rate-limit ingress bandwidth <0-100> Limit in magabits per second (0 is no limit) Switch(config-if)# rate-limit ingress bandwidth 8 Set the ingress rate limit 8Mbps for Port 1.
Port Trunking	
LACP	Switch(config)# lacp group 1 gi8-9 Group 1 based on LACP(802.3ad) is enabled!

	Note: The interface list is gi1-9 Note: different speed port can't be aggregated together.
LACP – Port Setting Long/Short Timeout **(V1.1 firmware)**	SWITCH(config-if)# lacp port-priority LACP priority for physical interfaces timeout assigns an administrative LACP timeout SWITCH(config-if)# lacp port-priority <1-65535> Valid port priority range 1 - 65535 (default is 32768) SWITCH(config-if)# lacp timeout long specifies a long timeout value (default) short specifies a short timeout value SWITCH(config-if)# lacp timeout short Set lacp port timeout ok.
Static Trunk	Switch(config)# trunk group 2 *gi6-7* Trunk group 2 enable ok!
Display - LACP	Swhitch# show lacp internal LACP group 1 is inactive LACP group 2 is inactive LACP group 3 is inactive LACP group 4 is inactive LACP group 5 is inactive
Display - Trunk	Switch# show trunk group 1 FLAGS: I -> Individual P -> In channel D -> Port Down Trunk Group TGID Protocol Ports -----+---------+---------- 1 Static 1(D) 2(D) Switch#

4.4 Network Redundancy

It is critical for industrial applications that network remains non-stop. The Switch's firmware supports IEEE 802.31D:2004 STP/RSTP, IEEE 802.1s Multiple Spanning Tree, Multiple Super Ring (M.S.R.) and backwad compatible with Legacy Super Ring.

The M.S.R. technology is patented 3rd generation ring technology which includes several of network redundant methods to supports a reliable, stable network transmission. It ranks the fastest restore and failover time in the world, 0ms for restore and about 5 ms for failover for copper.

The advanced Rapid Dual Homing technology also facilitates Switch to connect with a managed core Switch easily and conveniently. With RDH technology, you can also couple several Rapid Super Rings or RSTP network cloud together, which is also known as Auto Ring Coupling.

Each Managed Switch also can aggregate several Rapid Super Rings or RSTP clouds together and each Ring has its own Ring ID, the Ring ID will be added into ring-watchdog packet to monitor the ring status, this is patented multi-ring technology.

The Ring port can be configured as Static/LACP trunking port, after aggregates several port-trunk members, the member ports of the group will act as a ring path of the redundant ring to provide additional ring path redundant and bandwith, this is called TrunkRing technology.

To become backwards compatible with the Legacy Super Ring technology implemented in the Managed Switch product line, the Managed Switch also supports Super Ring Client mode. The Super Ring ports can pass through Super Ring control packets extremely well and works with Super Ring.

Besides the ring technology, *the managed Switch* also supports 802.1D-2004 version Rapid Spanning Tree Protocol (RSTP). New version of RSTP standard includes 802.1D-1998 STP, 802.1w RSTP and the IEEE 802.1s MSTP is available from the firmware version V1.1.

Following commands are included in this group:

4.4.1 STP Configuration

4.4.2 STP Port Configuration

4.4.3 STP Information

4.4.4 MSTP Configuration

4.4.5 MSTP Port Configuration

4.4.6 MSTP information

4.4.7 Multiple Super Ring

4.4.8 Multiple Super Ring Information

4.4.9 Command Lines for Network Redundancy

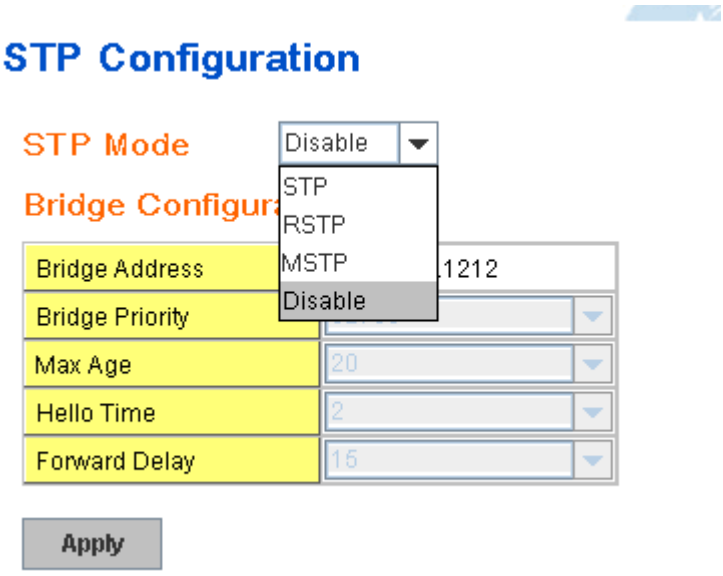
4.4.1 STP Configuration

This page allows select the STP mode and configuring the global STP/RSTP Bridge Configuraiton.

The STP mode includes the **STP**, **RSTP**, **MSTP** and **Disable**. Please select the STP mode for your system first. The default mode is RSTP enabled.

Afte select the STP or RSTP mode; continue to configure the gloable Bridge parameters for STP and RSTP.

After select the MSTP mode, please go to MSTP Configuration page.



RSTP (Refer to the 4.4.1 of previous version manual.)

RSTP is the abbreviation of Rapid Spanning Tree Protocol. If a switch has more than one path to a destination, it will lead to message loops that can generate broadcast storms and quickly bog down a network. The spanning tree was created to combat the negative effects of message loops in switched networks. A spanning tree uses a spanning tree algorithm (STA) to automatically sense whether a switch has more than one way to communicate with a node. It will then select the best path (primary), and block the other path(s). It will also keep track of the blocked path(s) in case the primary path fails. Spanning Tree Protocol (STP) introduced a standard method to accomplish this. It is specified in IEEE 802.1D-1998. Later, Rapid Spanning Tree Protocol (RSTP) was adopted and represents the evolution of STP, providing much faster spanning tree convergence after a topology change. This is specified in IEEE 802.1w. In 2004, 802.1w is included into 802.1D-2004 version. This switch supports both RSTP and STP (all switches that support RSTP are also backward compatible with switches that support only STP).

Bridge Configuration

Bridge Address: This shows the switch's MAC address.

Priority (0-61440): RSTP uses bridge ID to determine the root bridge, the bridge with the highest bridge ID becomes the root bridge. The bridge ID is composed of bridge priority and bridge MAC address. So that the bridge with the highest priority becomes the highest bridge ID. If all the bridge ID has the same priority, the bridge with the lowest MAC address will then become the root bridge.

Note: The bridge priority value must be in multiples of 4096. A device with a lower number has a higher bridge priority. Ex: 4096 is higher than 32768.

Note: The Web GUI allows user select the priority number directly. This is the convinent of the GUI design. When you configure the value through the CLI or SNMP, you may need to type the value directly. Please follow the n x 4096 ruls for the Bridge Priority.

Max Age (6-40): Enter a value from 6 to 40 seconds here. This value represents the time that a bridge will wait without receiving Spanning Tree Protocol configuration messages before attempting to reconfigure.

If JetNet is not the root bridge, and if it has not received a hello message from the root bridge in an amount of time equal to Max Age, then JetNet will reconfigure itself as a root bridge. Once two or more devices on the network are recognized as a root bridge, the devices will renegotiate to set up a new spanning tree topology.

Hello Time (1-10): Enter a value from 1 to 10 seconds here. This is a periodic timer that drives the switch to send out BPDU (Bridge Protocol Data Unit) packet to check current STP status.

The root bridge of the spanning tree topology periodically sends out a "hello" message to other devices on the network to check if the topology is "healthy". The "hello time" is the amount of time the root has waited during sending hello messages.

Forward Delay Time (4-30): Enter a value between 4 and 30 seconds. This value is the time that a port waits before changing from Spanning Tree Protocol learning and listening states to forwarding state.

This is the amount of time JetNet will wait before checking to see if it should be changed to a different state.

Once you have completed your configuration, click on **Apply** to apply your settings.

Note: You must observe the following rule to configure Hello Time, Forwarding Delay, and Max Age parameters.

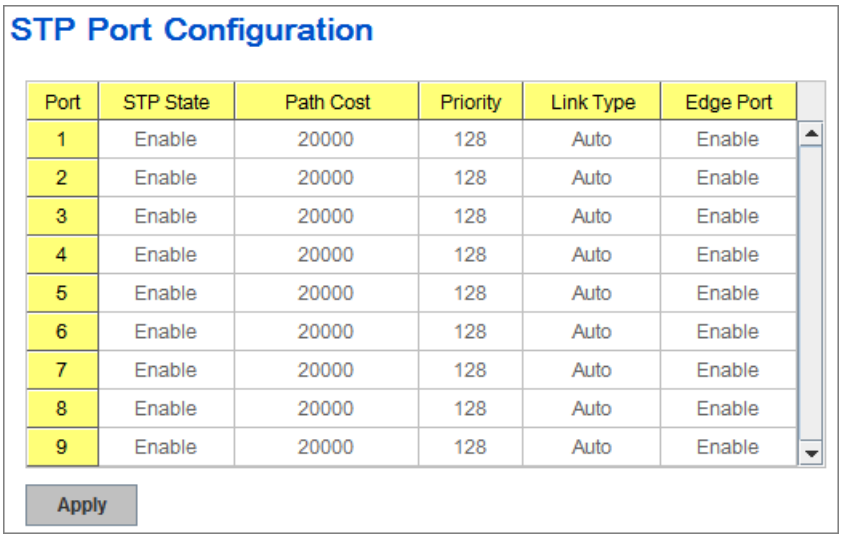
2 × (Forward Delay Time – 1 sec) ≥ Max Age Time ≥ 2 × (Hello Time value + 1 sec)

4.4.2 STP Port Configuration

The STP port configuration allows you to configure the port parameter after enabled STP function, and also supports per port STP enable/disable function here.

Port Configuration

Select the port you want to configure and you will be able to view current setting and status of the port.



STP State: Enable/Disable STP/RSTP/MSTP at this port. Disable STP state when connecting a device in order to avoid STP waiting periods.

Path Cost: Enter a number between 1 and 200,000,000. This value represents the “cost” of the path to the other bridge from the transmitting bridge at the specified port.

Priority: Enter a value between 0 and 240, using multiples of 16. This is the value that decides which port should be blocked by priority in a LAN.

Link Type: There are 3 types for you select. **Auto, P2P** and **Share.**

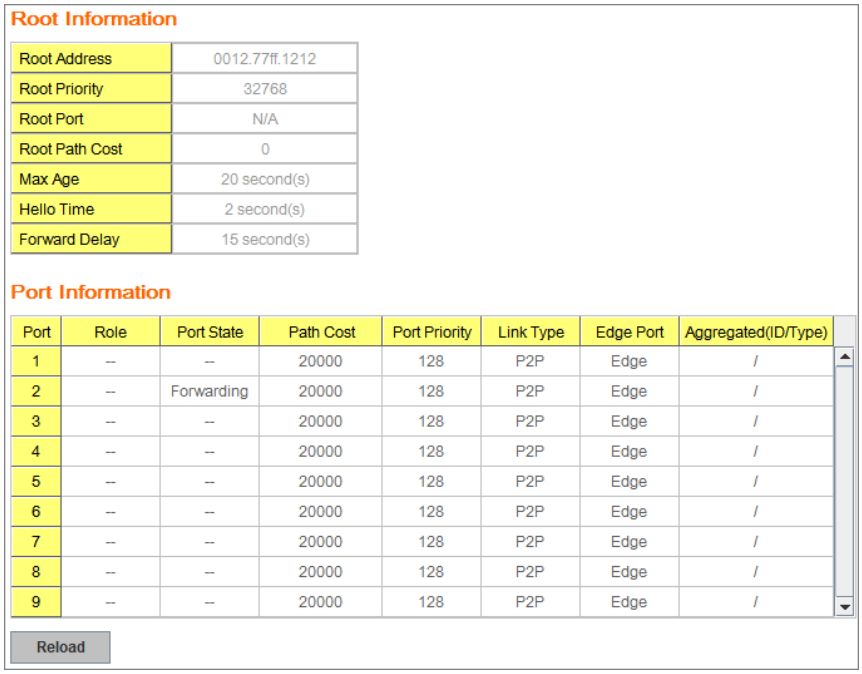
Some of the rapid state transitions that are possible within RSTP depend upon whether the port of concern can only be connected to another bridge (i.e. it is served by a point-to-point LAN segment), or if it can be connected to two or more bridges (i.e. it is served by a shared-medium LAN segment). This function allows link status of the link to be manipulated administratively. “**Auto**” means to auto select P2P or Share mode. “**P2P”** means P2P is enabled, the 2 ends work in Full duplex mode. While “**Share”** is enabled, it means P2P is disabled, the 2 ends may connect through a share media and work in Half duplex mode.

Edge: A port directly connected to the end stations cannot create a bridging loop in the network. To configure this port as an edge port, set the port to the **Enable** state. When the non-bridge device connects an admin edge port, this port will be in blocking state and turn to forwarding state in 4 seconds.

Once you finish your configuration, click on **Apply** to save your settings.

4.4.3 RSTP Info

This page allows you to see the information of the root switch and port status.



Root Information: You can see root Bridge ID, Root Priority, Root Port, Root Path Cost and the Max Age, Hello Time and Forward Delay of BPDU sent from the root switch.

Port Information: You can see port Role, Port State, Path Cost, Port Priority, Oper P2P mode, Oper edge port mode and Aggregated (ID/Type).

4.4.4 MSTP (Multiple Spanning Tree Protocol) Configuration

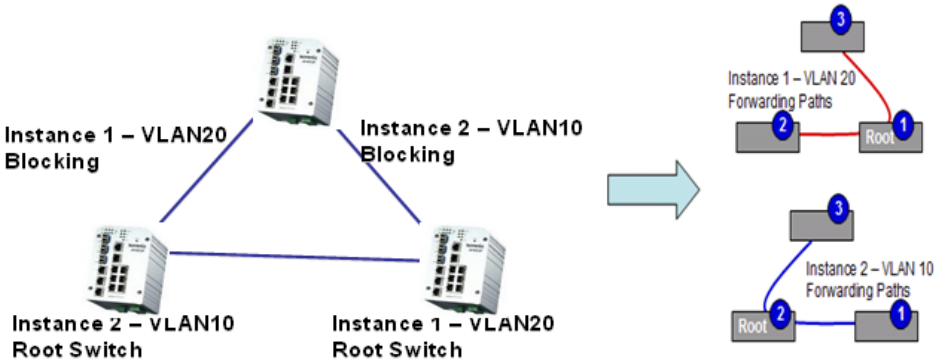
MSTP is the abbreviation of Multiple Spanning Tree Protocol. This protocol is a direct extension of RSTP. It can provide an independent spanning tree for different VLANs. It simplifies network management, provides for even faster convergence than RSTP by limiting the size of each region, and prevents VLAN members from being segmented from the rest of the group (as sometimes occurs with IEEE 802.1D STP).

While using MSTP, there are some new concepts of network architecture. A switch may belong to different group, acts as root or designate switch, generate BPDU for the network to maintain the forwarding table of the spanning tree. With MSTP, it can also provide multiple forwarding paths and enable load balancing. Understand the architecture allows you to

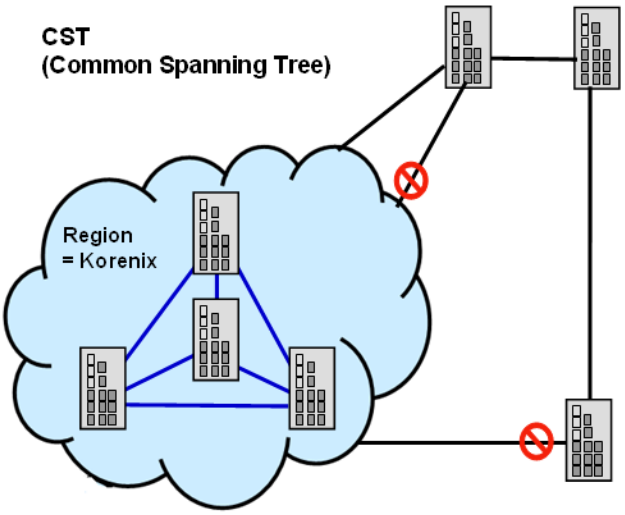
maintain the correct spanning tree and operate effectively.

One VLAN can be mapped to a Multiple Spanning Tree Instance (MSTI). The maximum Instance of the managed Switch supports is 16, range from 0-15. The MSTP builds a separate Multiple Spanning Tree (MST) for each instance to maintain connectivity among each of the assigned VLAN groups. An Internal Spanning Tree (IST) is used to connect all the MSTP switches within an MST region. An MST Region may contain multiple MSTP Instances.

The figure shows there are 2 VLANs/MSTP Instances and each instance has its Root and forwarding paths.

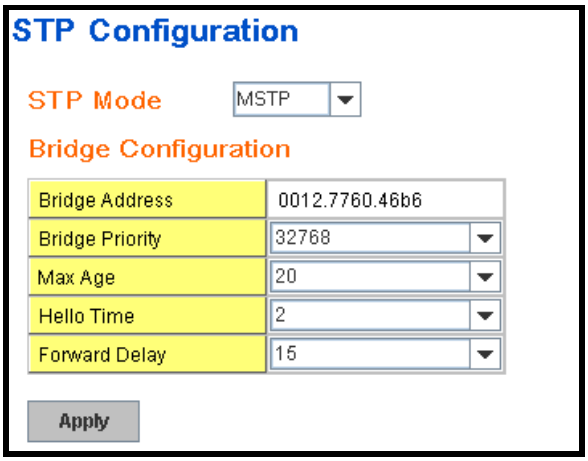


A Common Spanning Tree (CST) interconnects all adjuacent MST regions and acts as a virtual bridge node for communications with STP or RSTP nodes in the global network. MSTP connects all bridges and LAN segments with a single Common and Internal Spanning Tree (CIST). The CIST is formed as a result of the running spanning tree algorithm between switches that support the STP, RSTP, MSTP protocols.



The figure shows the CST large network. In this network, a Region may have different instances and its own forwarding path and table; however, it acts as a single Brige of CST.

To configure the MSTP setting, the STP Mode of the STP Configuration page should be changed to MSTP mode first.



After enabled MSTP mode, then you can go to the MSTP Configuraiton pages.

MSTP Region Configuration

This page allows configure the Region Name and its Revision, mapping the VLAN to Instance and check current MST Instance configuration. The network can be divided virtually to different Regions. The switches within the Region should have the same Region and Revision leve.

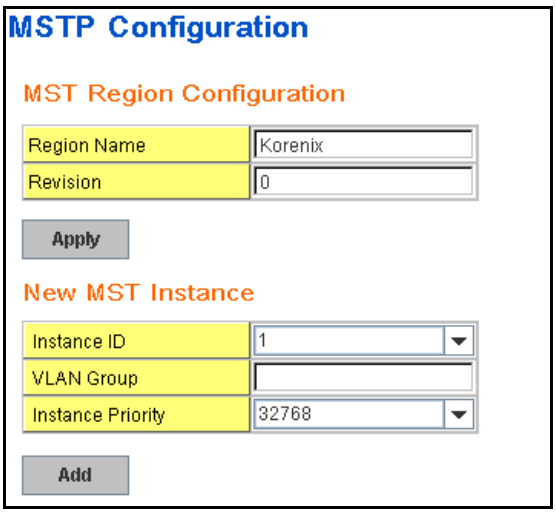
Region Name: The name for the Region. Maximum length: 32 characters.

Revision: The revision for the Region. Range: 0-65535; Default: 0)

Once you finish your configuration, click on **Apply** to apply your settings.

New MST Instance

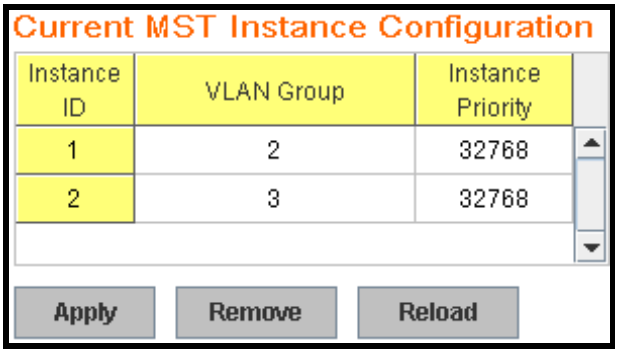
This page allows mapping the VLAN to Instance and assign priority to the instance. Before mapping VLAN to Instance, you should create VLAN and assign the member ports first. Please refer to the VLAN setting page.



Instance ID: Select the Instance ID, the available number is 1-15.
VLAN Group: Type the VLAN ID you want mapping to the instance.
Instance Priority: Assign the priority to the instance.
After finish your configuration, click on **Add** to apply your settings.

Current MST Instance Configuration

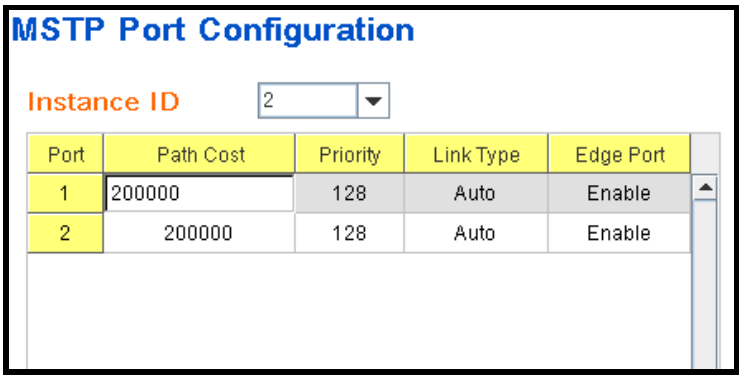
This page allows you to see the current MST Instance Configuration you added. Click on "**Apply**" to apply the setting. You can "**Remove"** the instance or "**Reload**" the configuration display in this page.



4.4.5 MSTP Port Configuration

This page allows configure the Port settings. Choose the Instance ID you want to configure. The MSTP enabled and linked up ports within the instance will be listed in this table.

Note that the ports not belonged to the Instance, or the ports not MSTP activated will not display. The meaning of the Path Cost, Priority, Link Type and Edge Port is the same as the definition of RSTP.



Path Cost: Enter a number between 1 and 200,000,000. This value represents the “cost” of the path to the other bridge from the transmitting bridge at the specified port.

Priority: Enter a value between 0 and 240, using multiples of 16. This is the value that decides which port should be blocked by priority in a LAN.

Link Type: There are 3 types for you select. **Auto, P2P** and **Share.**

Some of the rapid state transitions that are possible within RSTP depend upon whether the port of concern can only be connected to another bridge (i.e. it is served by a point-to-point LAN segment), or if it can be connected to two or more bridges (i.e. it is served by a shared-medium LAN segment). This function allows link status of the link to be manipulated administratively. “**Auto**” means to auto select P2P or Share mode. “**P2P”** means P2P is enabled; the 2 ends work in full duplex mode. While “**Share”** is enabled, it means P2P is disabled; the 2 ends may connect through a share media and work in half duplex mode.

Edge: A port directly connected to the end stations cannot create a bridging loop in the network. To configure this port as an edge port, set the port to the **Enable** state. When the non-bridge device connects an admin edge port, this port will be in blocking state and turn to forwarding state in 4 seconds.

Once you finish your configuration, click on **Apply** to save your settings.

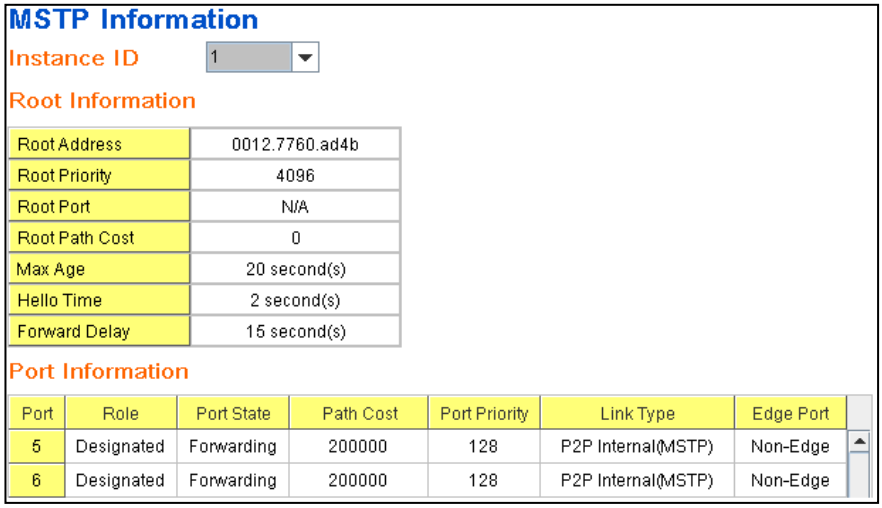
4.4.6 MSTP Information

This page allows you to see the current MSTP information.

Choose the **Instance ID** first. If the instance is not added, the information remains blank.

The **Root Information** shows the setting of the Root switch.

The **Port Information** shows the port setting and status of the ports within the instance.



Click “**Reload**“ to reload the MSTP information display.

4.4.7 Multiple Super Ring (MSR) (The same as 4.4.31 of previous version manual.)

The most common industrial network redundancy is to form a ring or loop. Typically, the managed switches are connected in series and the last switch is connected back to the first one. In such connection, you can implement the Multiple Super Ring technology to get fatest recovery performance.

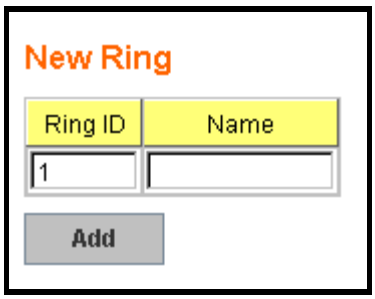
Multiple Super Ring (MSR) technology is 3rd generation Ring redundancy technology. This is patented and protected, and is used in countries all over the world. MSR ranks the fastest restore and failover time in the world, 0 ms for restore and about milliseconds level for failover for 100Base-TX copper port. The other interface may take longer time due to the media characteristics.

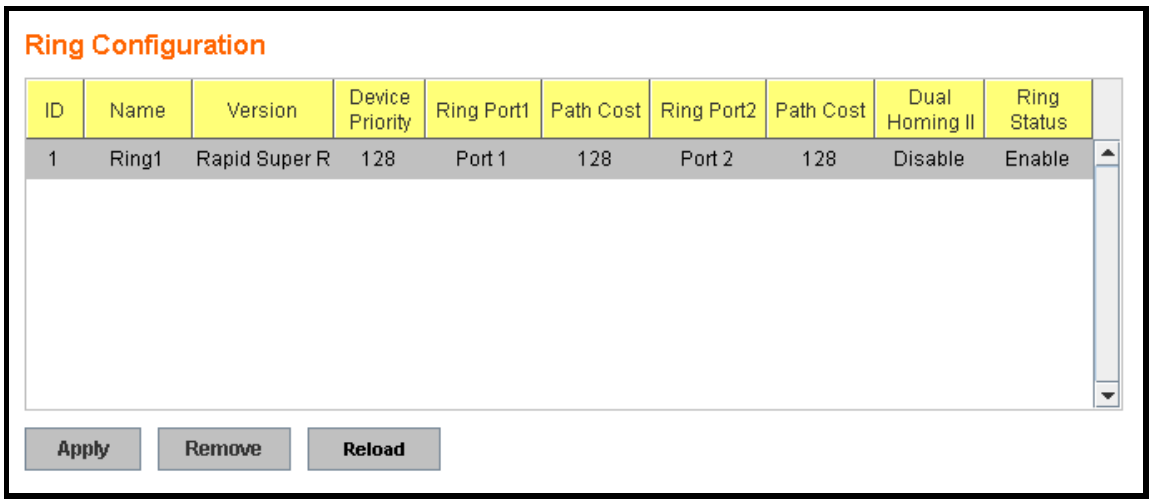
Advanced **Rapid Dual Homing (RDH)** technology also facilitates *JetNet Managed Switch* to connect with a core managed switch easily and conveniently. With RDH technology, you can also couple several Rapid Super Rings or RSTP cloud together, which is also known as Auto Ring Coupling.

TrunkRing technology allows integrate MSR with LACP/Port Trunking. The LACP/Trunk aggregated ports is a virtual interface and it can work as the Ring port of the MSR.

MultiRing is an outstanding technology that most of managed industrial Switch can support. The MultiRing teechnogy can aggregate many MSR rings within one Managed Switch by using different Ring ID. The maximum Ring number one switch can support is half of port volume. For example, the 9-port managed Switch equipped 9 Ethernet ports, which means maximum 4 Rings (4 Gigabit Rings) can be aggregated to a 9-port Managed Switch. The feature saves much effort when constructing complex network architecture.

New Ring: To create a Rapdis Super Ring. Jjust fill in the Ring ID which has range from 0 to 31. If the name field is left blank, the name of this ring will be automatically naming with Ring ID.





Ring Configuration

ID: Once a Ring is created, this appears and can not be changed.

Name: This field will show the name of the Ring. If it is not filled in when creating, it will be automatically named by the rule “RingID”.

Version: The version of Ring can be changed here. There are three modes to choose: Rapid Super Ring as default; Super ring for compatible with Korenix 1st general ring and Any Ring for compatible with other version of rings.

Device Priority: The switch with highest priority (highest value) will be automatically selected as Ring Master. Then one of the ring ports in this switch will become forwarding port and the other one will become blocking port. If all of the switches have the same priority, the switch with the biggest MAC address will be selected as Ring Master.

Ring Port1: In Rapid Super Ring environment, you should have 2 Ring Ports. No matter this switch is Ring Master or not, when configuring RSR, 2 ports should be selected to be Ring Ports. For Ring Master, one of the ring ports will become the forwarding port and the other one will become the blocking port.

Path Cost: Change the Path Cost of Ring Port1. If this switch is the Ring Master of a Ring, then it determines the blocking port. The Port with higher Path Cost in the two ring ports will become the blocking port, If the Path Cost is the same, the port with larger port number will become the blocking port.

Ring Port2: Assign another port for ring connection

Path Cost: Change the Path Cost of Ring Port2

Rapid Dual Homing (RDH): Rapid Dual Homing is another important feature of 3rd generation Ring redundancy technology. When you want to connect multiple RSR or form a redundant topology with other vendors, RDH could allow you to have maximum 7 multiple links for redundancy without any problem.

In Dual Homing I released with JetNet 4000/4500 series, you have to configure additional port as Dual Homing port to two uplink switches. In Rapid Dual Homing, you don’t need to configure specific port to connect to other protocol. The Rapid

Dual Homing will smartly choose the fastest link for primary link and block the other link to avoid loop. If the primary link failed, Rapid Dual Homing will automatically forward the secondary link for network redundant. Of course, if there are more connections, they will be standby links and recover one of then if both primary and secondary links are broken.

Ring status: To enable/disable the Ring. Please remember to enable the ring after you add it.

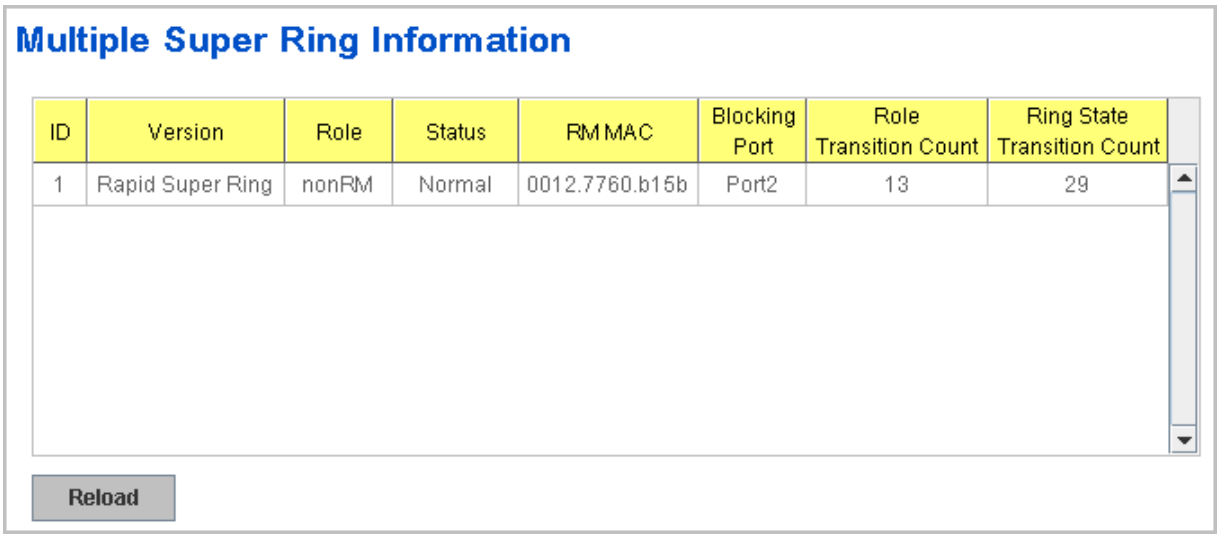
MultiRing: The MultiRing technology is one of the patterns of the MSR technology; it allows you to aggregate multiple rings within one switch. Create multiple Ring ID and assign different ring port 1 and port 2 to each ring, thus the switch can have multiple rings in one JetNet Switch.

When implementing MultiRing, remember that the different rings can NOT use the same ring ID. The other settings are the same as above description. Technically, the maximum ring volume the MultiRing supported is up to 16 rings. Due the limited number of ports, the number of ring network is the half of port number.

TrunkRing: The MultiRing technology is part of the MSR technology which combines the MSR with the port trunking technology. After multiple ports aggregated, this is so-call port trunking (Staticly or learnt by LACP protocol), the Trunk ID can be one of the port ID of the MSR technology. Configured the port trunking first then you can add the Trunk group as a Ring Port in managed switch.

4.4.8 **Ring Info**

This page shows the RSR information.



ID: Ring ID.

Version: which version of this ring, this field could be Rapid Super Ring, Super Ring, or Any Ring

Role: This Switch is RM or nonRM

Status: If this field is Normal which means the redundancy is approved. If any one of the link in this Ring is broken, then the status will be Abnormal.

RM MAC: The MAC address of Ring Master of this Ring. It helps to find the redundant path.

Blocking Port: This field shows which is blocked port of RM.

Role Transition Count: This means how many times this switch has changed its Role from nonRM to RM or from RM to nonRM.

Role state Transition Count: This number means how many times the Ring status has been transformed between Normal and Abnormal state.

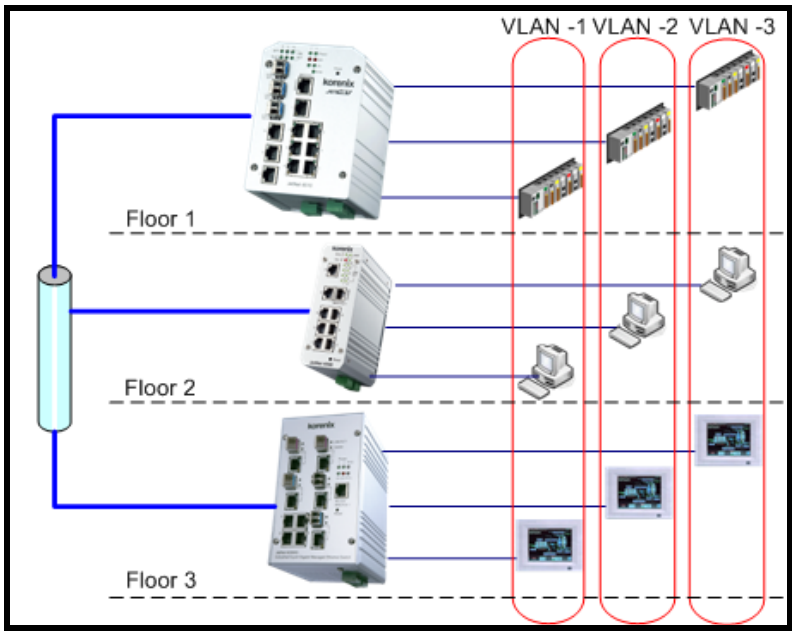
4.5 VLAN

A Virtual LAN (VLAN) is a “logical” grouping of nodes for the purpose of limiting a broadcast domain to specific members of a group without physically grouping the members together. That means, VLAN allows you to isolate network traffic so that only members of VLAN could receive traffic from the same VLAN members. Basically, creating a VLAN from a switch is the logical equivalent of physically reconnecting a group of network devices to another Layer 2 switch, without actually disconnecting these devices from their original switches.

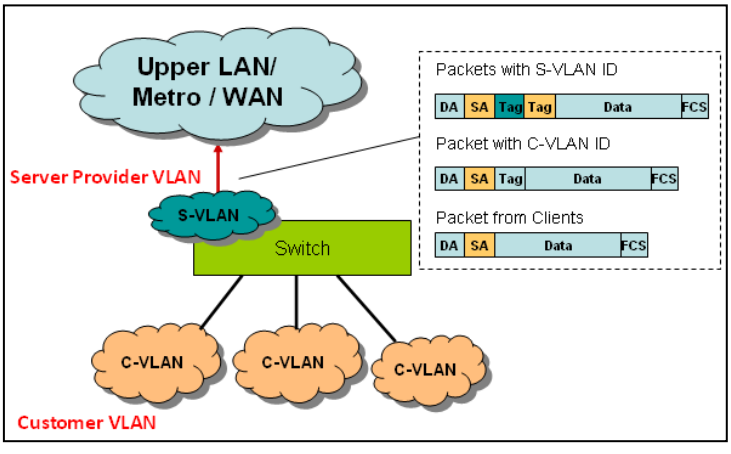
The managed industrial Ethernet Switch supports 802.1Q VLAN. 802.1Q VLAN is also known as Tag-Based VLAN. This Tag-Based VLAN allows VLAN to be created across different switches (see Figure 1). IEEE 802.1Q tag-based VLAN makes use of VLAN control information stored in a VLAN header attached to IEEE 802.3 packet frames. This tag contains a VLAN Identifier (VID) that indicates which VLAN a frame belongs to. Since each switch only has to check a frame’s tag, without the need to dissect the contents of the frame, this also saves a lot of computing resources within the switch.

Figure 4.5-1 802.1Q VLAN



QinQ

In JetNet6059G firmware V1.1, Korenix release extended VLAN feature, QinQ. The QinQ is originally designed to expand the number of VLANs by adding a tag to the 802.1Q packets.



The original VLAN is usually identified as Customer VLAN (C-VLAN) and the new added tag - as Service VLAN(S-VLAN). By adding the additional tag, QinQ increases the possible number of VLANs. After QinQ enabled, the managed Switch can reach up to 256x256 VLANs. With different standard tags, it also improves the network security.

VLAN Configuration group enables you to Add/Remove VLAN, configure QinQ, port Ingress/Egress parameters and view VLAN table.

Following commands are included in this group:

4.5.1 VLAN Port Configuration

4.5.2 VLAN Configuration

4.5.3 GVRP Configuration

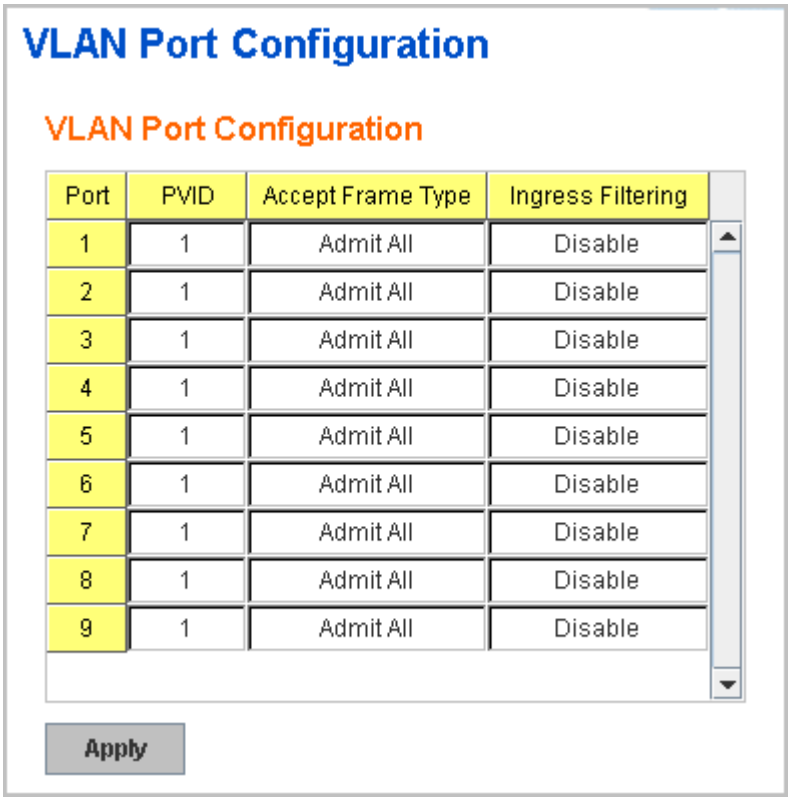
4.5.4 VLAN Table

4.5.5 CLI Commands of the VLAN

4.5.1 VLAN Port Configuration

VLAN Port Configuration allows you to set up VLAN port parameters to specific port. These parameters include PVID, Accept Frame Type and Ingress Filtering.

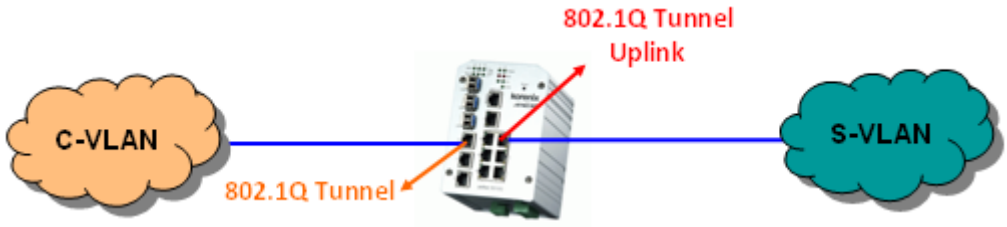
Figure 4.5.1-1 Web UI of VLAN configuration.



PVID: The abbreviation of the **Port VLAN ID**. Enter port VLAN ID here. PVID allows the switches to identify which port belongs to which VLAN. To keep things simple, it is recommended that PVID is equivalent to VLAN IDs.

The values of PVIDs are from 0 to 4095. But, 0 and 4095 are reserved. You can't input these 2 PVIDs. 1 is the default value. 2 to 4094 are valid and available in this column. Type the PVID you'd like to configure here.

Tunnel Mode: This is the new command for QinQ. The command includes None, 802.1Q Tunnel and 802.1Q Tunnel Uplink. The figure shows the relationship between 802.1Q Tunnel and 802.1Q Tunnel Uplink.



Following is the modes you can select.

None: Remian VLAN setting, no QinQ.

802.1Q Tunnel: The QinQ command applied to the ports which connect to the C-VLAN. The port receives tagged frame from the C-VLAN. Add a new tag (Port VID) as S-VLAN VID. When the packets are forwarded to C-VLAN, the S-VLAN tag is removed.

After 802.1Q Tunnel mode is assigned to a port, the egress setting of the port should be "**Untag**", it indicates the egress packet is always untagged. This is configured in Static VLAN Configuration table. Please refer to the VLAN Configuration chapter in below.

802.1Q Tunnel Uplink: The QinQ command applied to the ports which connect to the S-VLAN. The port receives tagged frame from the S-VLAN. When the packets are forwarded to S-VLAN, the S-VLAN tag is kept.

After 802.1Q Tunnel Uplink mode is assigned to a port, the egress setting of the port should be "**Tag**", it indicates the egress packet is always tagged. This is configured in Static VLAN Configuration table. Please refer to the VLAN Configuration chapter in below.

For example, the VID of S-VLAN/Tunnel Uplink is 10, the VID of C-VLAN/Tunnel is 5. The 802.1Q Tunnel port receives tag 5 from C-VLAN, add tag 10 to the packet. When the packets are forwarded to S-VLAN, tag 10 is kept.

Accept Frame Type: This column defines the accepted frame type of the port. There are 2 modes you can select, **Admit All** and **Tag Only**. Admit All mode means that the port can accept both tagged and untagged packets. Tag Only mode means that the port can only accept tagged packets.

Ingress Filtering: Ingress filtering helps VLAN engine to filter out undesired traffic on a port. When Ingress Filtering is enabled, the port checks whether the incoming frames belong to the VLAN they claimed or not. Then the port determines if the frames can be processed or not. For example, if a tagged frame from Engineer VLAN is received, and Ingress Filtering is enabled, the switch will determine if the port is on the Engineer

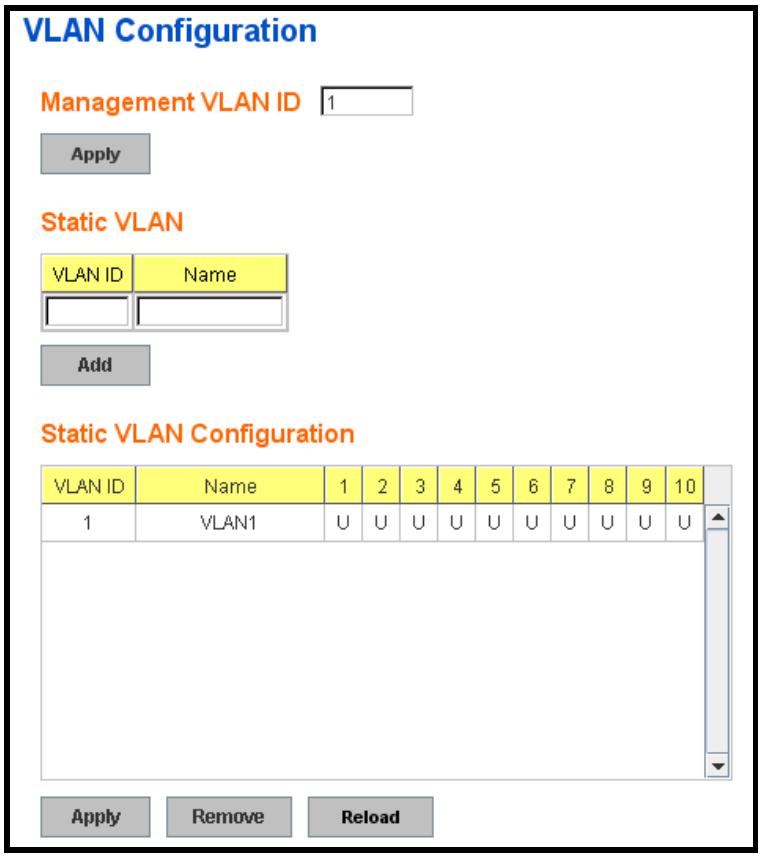
VLAN's Egress list. If it is, the frame can be processed. If it's not, the frame would be dropped.

After 802.1Q Tunnel or 802.1Q Tunnel Uplink is enabled, the Ingress Filtering can not be configured.

4.5.2 VLAN Configuration

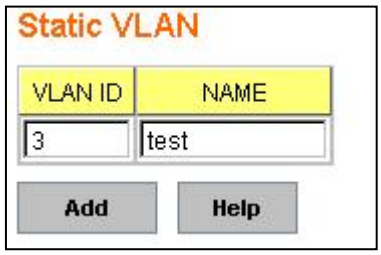
In this page, you can assign Management VLAN, create the static VLAN, and assign the Egress rule for the member ports of the VLAN.

Figure 4.5.2-1 Web UI of the VLAN Configuration.



Management VLAN ID: The switch supports management VLAN. The management VLAN ID is the VLAN ID of the CPU interface so that only member ports of the management VLAN can ping and access the switch. The default management VLAN ID is "**1**".

Static VLAN: You can assign a VLAN ID and VLAN Name for new VLAN here.



VLAN ID is used by the switch to identify different VLANs. Valid VLAN ID is between 1 and 4094. 1 is the default VLAN.

VLAN Name is a reference for network administrator to identify different VLANs. The available character is 12 for you to input. If you don't input VLAN name, the system will automatically assign VLAN name for the VLAN. The rule is VLAN (VLAN

ID).

Figure 4.5.2-2 The steps to create a new VLAN: Type VLAN ID and NAME, and press **Add** to create a new VLAN. Then you can see the new VLAN in the Static VLAN Configuration table. Refer to Figure 4.5-5

After created the VLAN, the status of the VLAN will remain in Unused until you add ports to the VLAN.

Note: *Before you change the management VLAN ID by Web and Telnet, remember that the port attached by the administrator should be the member port of the management VLAN; otherwise the administrator can't access the switch via the network.*

Note: *Currently the Switch only support max 256 VLAN groups.*

Static VLAN Configuration

You can see the created VLANs and specify the egress (outgoing) port rule to be **Untagged or Tagged** here.

Figure 4.5.2-3 below shows the Static VLAN Configuration table. You can see that new VLAN 3 (test) is created and the Egress rules of the ports are not configured now.

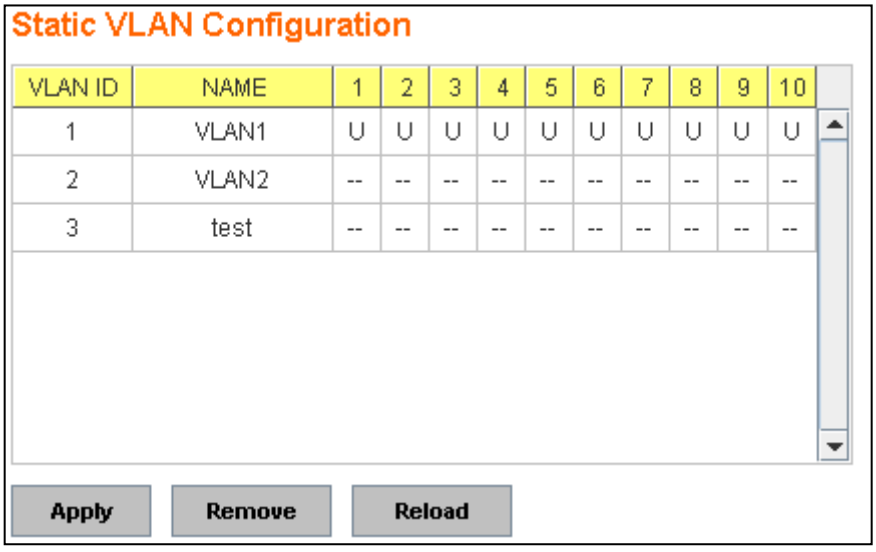


Figure 4.5.2-4 Configure Egress rule of the ports.

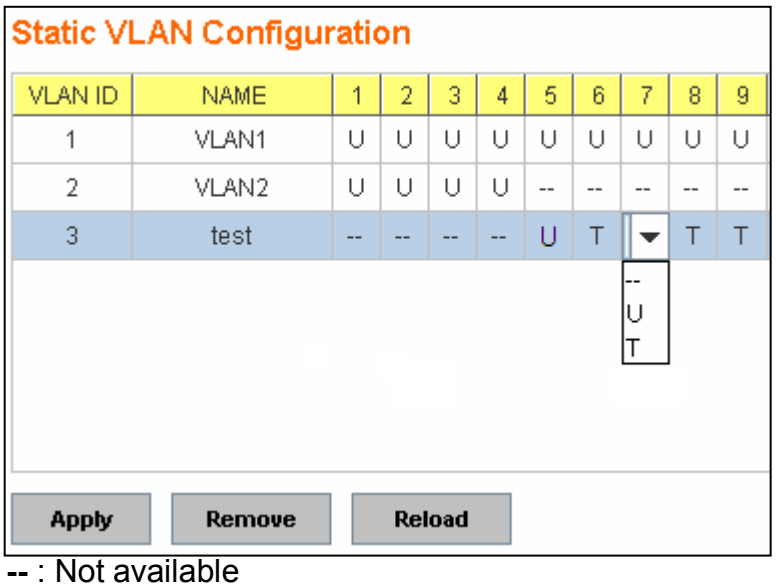


-- : Not available

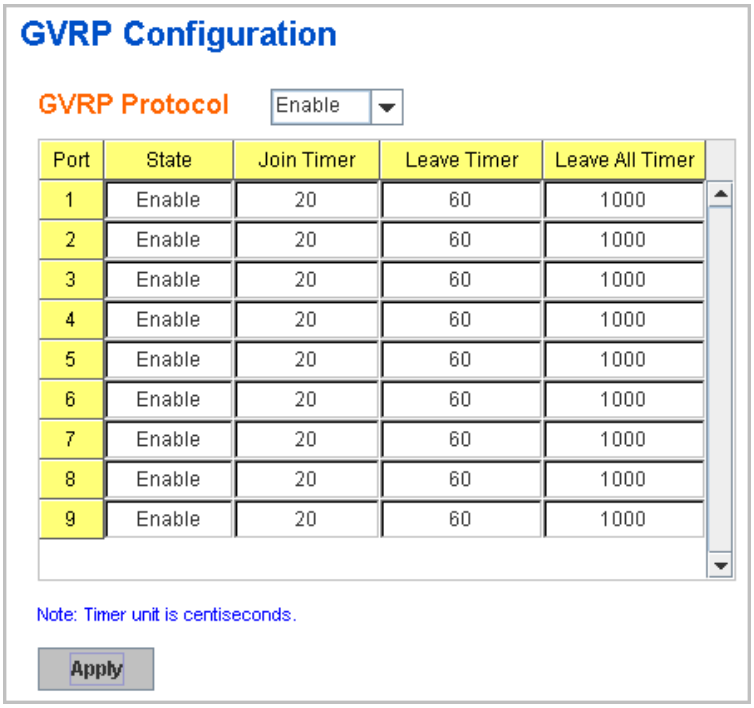
U: **Untag**: Indicates that egress/outgoing frames are not VLAN tagged.

T : **Tag**: Indicates that egress/outgoing frames are to be VLAN tagged.

Steps to configure Egress rules: Select the VLAN ID. Entry of the selected VLAN turns to light blue. Assign Egress rule of the ports to **U** or **T**. Press **Apply** to apply the setting. If you want to remove one VLAN, select the VLAN entry. Then press **Remove** button.

4.5.3 GVRP configuration

GVRP allows users to set-up VLANs automatically rather than manual configuration on every port of every switch in the network.



GVRP Protocol: Allow user to enable/disable GVRP globally.

State: After enable GVRP globally, here still can enable/disable GVRP by port.

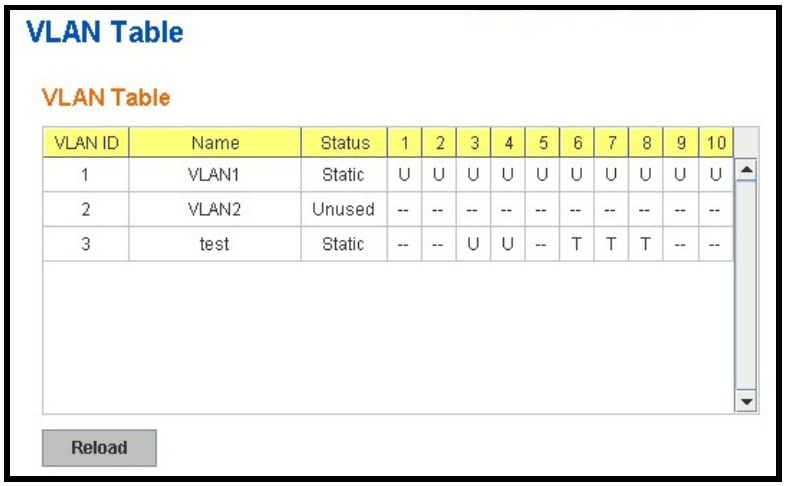
Join Timer: Controls the interval of sending the GVRP Join BPDU. An instance of this timer is required on a per-Port, per-GARP Participant basis

Leave Timer: Control the time to release the GVRP reservation after received the GVRP Leave BPDU. An instance of the timer is required for each state machine that is in the LV state

Leave All Timer: Controls the period to initiate the garbage collection of registered VLAN. The timer is required on a per-Port, per-GARP Participant basis

4.5.4 VLAN Table

This table shows you current settings of your VLAN table, including VLAN ID, Name, Status, and Egress rule of the ports.



VLAN ID: ID of the VLAN.

Name: Name of the VLAN.

Status: Static shows this is a manually configured static VLAN. **Unused** means this VLAN is created by UI/CLI and has no member ports. This VLAN is not workable yet. **Dynamic** means this VLAN is learnt by GVRP.

After created the VLAN, the status of this VLAN will remain in Unused status until you add ports to the VLAN.

4.5.5 CLI Commands of the VLAN

Command Lines of the VLAN port configuration, VLAN configuration and VLAN table display

Feature	Command Line

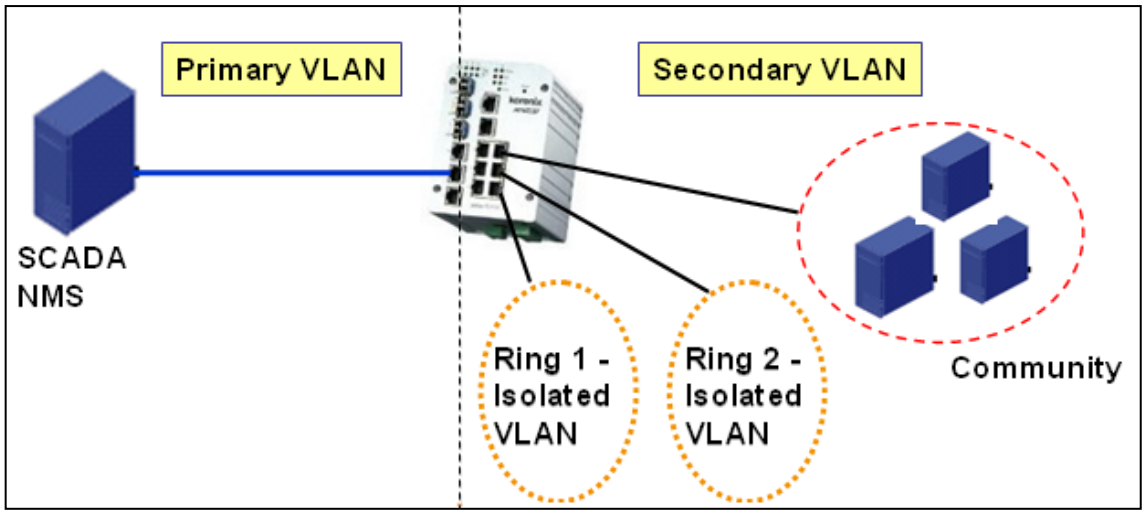
4.6 Private VLAN

The private VLAN helps to resolve the primary VLAN ID shortage, client ports' isolation and network security issues. The Private VLAN provides primary and secondary VLAN within a single switch.

Primary VLAN: The uplink port is usually the primary VLAN. A primary VLAN contains promiscuous ports that can communicate with lower Secondary VLANs.

Secondary VLAN: The client ports are usually defined within secondary VLAN. The secondary VLAN includes Isolated VLAN and Community VLAN. The client ports can be isolated VLANs or can be grouped in the same Community VLAN. The ports within the same community VLAN can communicate with each other. However, the isolated VLAN ports can Not.

The figure shows the typical Private VLAN network. The SCADA/Public Server or NMS workstation is usually located in primary VLAN. The clients PCs or Rings are located within Secondary.



Private VLAN (PVLAN) Configuration group enables you to Configure PVLAN, PVLAN Port and see the PVLAN Information.

Following commands are included in this group:

4.6.1 PVLAN Configuration

4.6.2 PVLAN Port Configuration

4.6.3 CLI Commands of the PVLAN

4.6.1 PVLAN Configuration

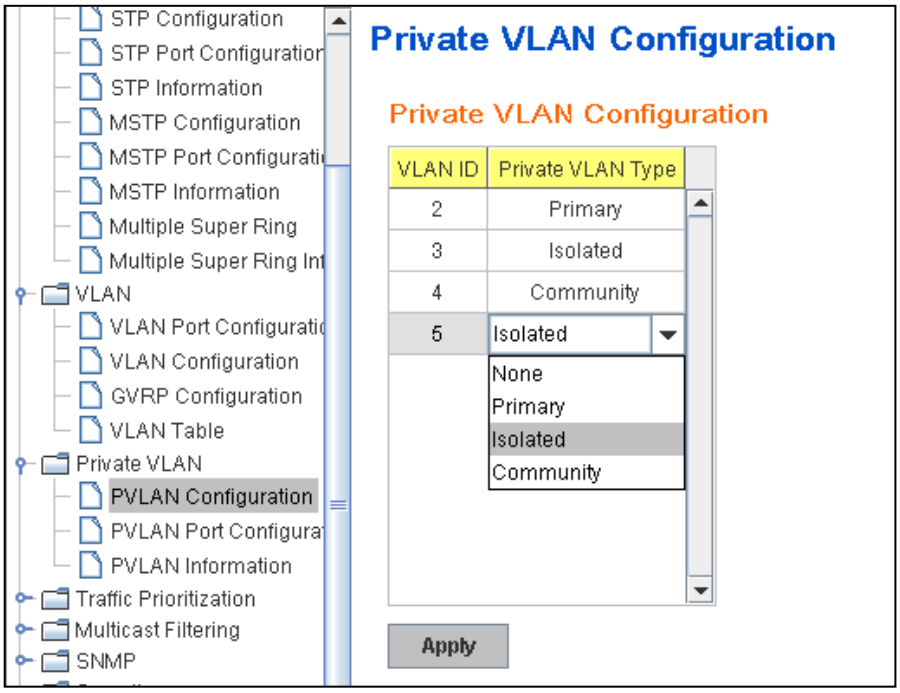
PVLAN Configuration allows you to assign Private VLAN type. After created VLAN in VLAN Configuraiton page, the available VLAN ID will display here. Choose the Private VLAN types for each VLAN you want configure.

None: The VLAN is Not included in Private VLAN.

Primary: The VLAN is the Primary VLAN. The member ports can communicate with secondary ports.

Isolated: The VLAN is the Isolated VLAN. The member ports of the VLAN are isolated.

Community: The VLAN is the Community VLAN. The member ports of the VLAN can communicate with each other.



4.6.2 PVLAN Port Configuration

PVLAN Port Configuration page allows configure Port Configuration and Private VLAN Association.

Private VLAN Association

Secondary VLAN: After the Isolated and Community VLAN Type is assigned in Private VLAN Configuration page, the VLANs are belonged to the Secondary VLAN and displayed here.

Primary VLAN: After the Primary VLAN Type is assigned in Private VLAN Configuration page, the secondary VLAN can associate to the Primary VLAN ID. Select the Primary VLAN ID here.

Note: Before configuring PVLAN port type, the Private VLAN Association should be done first.

Port Configuraion

PVLAN Port Type :

Normal: The Normal port is None PVLAN ports, it remains its original VLAN setting.

Host: The Host type ports can be mapped to the Secondary VLAN.

Promiscuous: The promiscuous port can be associated to the Primary VLAN.

VLAN ID: After assigned the port type, the web UI display the available VLAN ID the port can associate to.

For example:

1. VLAN Create: VLAN 2-5 are created in VLAN Configuration page.

2. Private VLAN Type: VLAN 2-5 has its Private VLAN Type configured in Private VLAN Configuration page.

VLAN 2 is belonged to Primary VLAN.

VLAN 3-5 are belonged to secondary VLAN (Isolated or Community).

3. Private VLAN Association: Associate VLAN 3-5 to VLAN 2 in Private VLAN Association first.

4. Private VLAN Port Configuraiton

VLAN 2 – Primary -> The member port of VLAN 2 is promiscuous port.

VLAN 3 – Isolated -> The Host port can be mapped to VLAN 3.

VLAN 4 – Community -> The Host port can be mapped to VLAN 3.

VLAN 5 – Community -> The Host port can be mapped to VLAN 3.

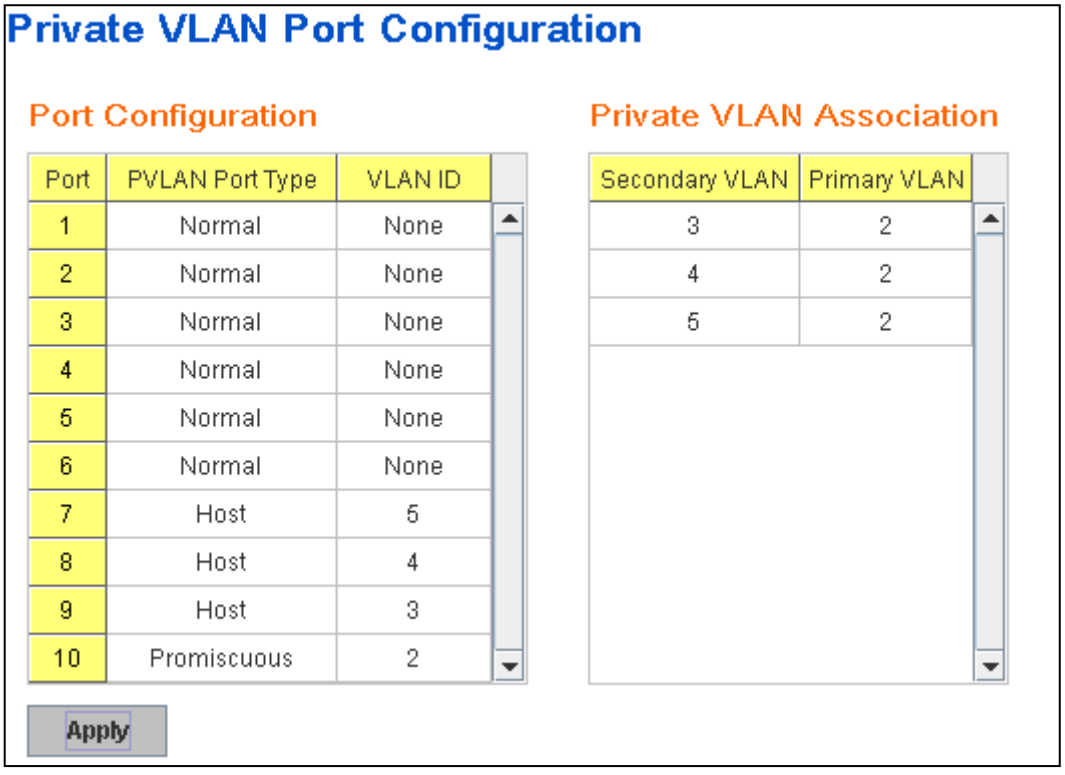
5. Result:

VLAN 2 -> VLAN 3, 4, 5; member ports can communicate with ports in secondary VLAN.

VLAN 3 -> VLAN 2, member ports are isolated, but it can communicate with member port of VLAN 2..

VLAN 4 -> VLAN 2, member ports within the community can communicate with each other and communicate with member port of VLAN 2.

VLAN 5 -> VLAN 2, member ports within the community can communicate with each other and communicate with member port of VLAN 2.



4.6.3 Private VLAN Information

This page allows you to see the Private VLAN information.

4.7 Traffic Prioritization

Quality of Service (QoS) provides traffic prioritization mechanism which allows users to deliver better service to certain flows. QoS can also help to alleviate congestion problems and ensure high-priority traffic is delivered first. This section allows you to configure Traffic Prioritization settings for each port with regard to setting priorities.

JetNet switch's QOS supports 4 physical queues, weighted fair queuing (WRR) and Strict Priority scheme, which follows 802.1p COS tag and IPv4 TOS/DiffServ information to prioritize the traffic of your industrial network.

Following commands are included in this group:

4.7.1 QoS Setting

4.7.2 CoS-Queue Mapping

4.7.3 DSCP-Queue Mapping

4.7.4 CLI Commands of the Traffic Prioritization

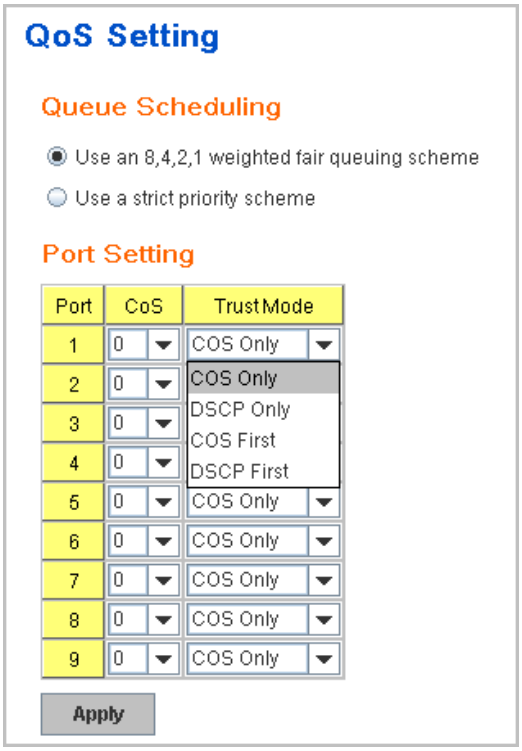
4.7.1 QoS Setting

Queue Scheduling

You can select the Queue Scheduling rule as follows:

Use an 8,4,2,1 weighted fair queuing scheme. This is also known as **WRR** (Weight Round Robin)**.** JetNet will follow 8:4:2:1 rate to process the packets in a queue from the highest priority to the lowest. For example, the system will process 8 packets with the highest priority in the queue, 4 with middle priority, and 2 with low priority, and 1 with the lowest priority at the same time.

Use a strict priority scheme. Packets with higher priority in the queue will always be processed first, except that there is no packet with higher priority.



Port Setting

CoS column is to indicate default port priority value for untagged or priority-tagged frames. When JetNet receives the frames, JetNet will attach the value to the CoS field of the incoming VLAN-tagged packets. You can enable 0,1,2,3,4,5,6 or 7 to the port.

Trust Mode is to indicate Queue Mapping types for you to select.

COS Only: Port priority will only follow COS-Queue Mapping you have assigned.

DSCP Only: Port priority will only follow DSCP-Queue Mapping you have assigned.

COS first: Port priority will follow COS-Queue Mapping first, and then DSCP-Queue Mapping rule.

DSCP first: Port priority will follow DSCP-Queue Mapping first, and then COS-Queue Mapping rule.

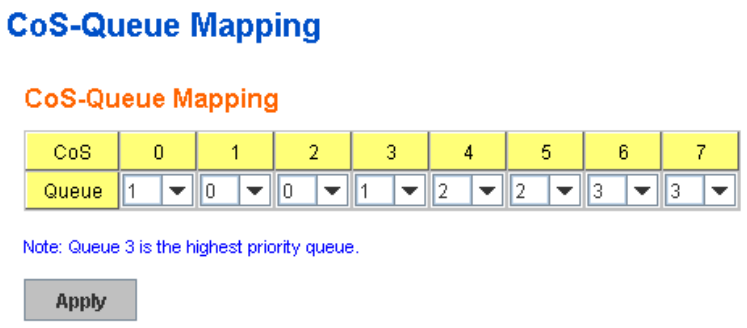
Default priority type is **COS Only**. The system will provide default COS-Queue table to which you can refer for the next command.

After configuration, press **Apply** to enable the settings.

4.7.2 CoS-Queue Mapping

This page is to change CoS values to Physical Queue mapping table. Since the switch fabric of JetNet only supports 4 physical queues, Lowest, Low, Middle and High. Users should therefore assign how to map CoS value to the level of the physical queue.

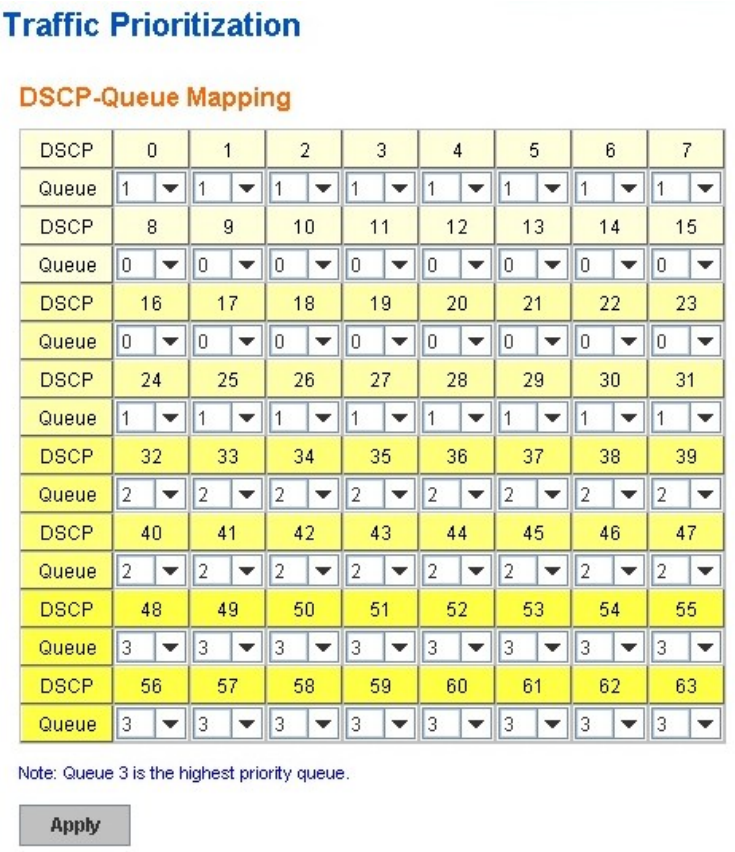
In JetNet management switch, users can freely assign the mapping table or follow the suggestion of the 802.1p standard. Korenix uses 802.1p suggestion as default values. You can find CoS values 1 and 2 are mapped to physical Queue 0, the lowest queue. CoS values 0 and 3 are mapped to physical Queue 1, the low/normal physical queue. CoS values 4 and 5 are mapped to physical Queue 2, the middle physical queue. CoS values 6 and 7 are mapped to physical Queue 3, the high physical queue.



After configuration, press **Apply** to enable the settings.

4.7.3 DSCP-Queue Mapping

This page is to change DSCP values to Physical Queue mapping table. Since the switch fabric of JetNet only supports 4 physical queues, Lowest, Low, Middle and High. Users should therefore assign how to map DSCP value to the level of the physical queue. In JetNet, users can freely change the mapping table to follow the upper layer 3 switch or routers' DSCP setting.



After configuration, press **Apply** to enable the settings.

4.7.4 CLI Commands of the Traffic Prioritization

Command Lines of the Traffic Prioritization configuration

Feature	Command Line
QoS Setting	
Queue Scheduling – Strict Priority	Switch(config)# qos queue-sched sp Strict Priority wrr Weighted Round Robin (Use an 8,4,2,1 weight) Switch(config)# qos queue-sched sp <cr>

4.8 Multicast Filtering

For multicast filtering, the managed Switch uses IGMP Snooping technology. IGMP (Internet Group Management Protocol) is an Internet Protocol that provides a way for internet device to report its multicast group membership to adjacent routers. Multicasting allows one computer on the internet to send data to a multitude of other computers that have identified themselves as being interested in receiving the originating computers data.

Multicasting is useful for such applications as updating the address books of mobile computer users in the field, sending out newsletters to a distribution list, and broadcasting streaming media to an audience that has tuned into the event by setting up multicast group membership.

In effect, IGMP Snooping manages multicast traffic by making use of switches, routers, and hosts that support IGMP. Enabling IGMP Snooping allows the ports to detect IGMP queries, report packets, and manage multicast traffic through the switch. IGMP has three fundamental types of messages, as shown below:

Message	Description
Query	A message sent from the querier (an IGMP router or a switch) which asks for a response from each host that belongs to the multicast group.
Report	A message sent by a host to the querier to indicate that the host wants to be or is a member of a given group indicated in the report message.
Leave Group	A message sent by a host to the querier to indicate that the host has quit as a member of a specific multicast group.

You can enable **IGMP Snooping** and **IGMP Query** functions here. You will see the information of the IGMP Snooping function in this section, including different multicast groups' VID and member ports, and IP multicast addresses that range from 224.0.0.0 to 239.255.255.255.

In this section, Force filtering can determined whether the switch flooding unknown multicast or not.

Following commands are included in this group:

4.8.1 IGMP Snooping

4.8.2 IGMP Query

4.8.3 Force Filtering

4.8.4 GMRP Configuration

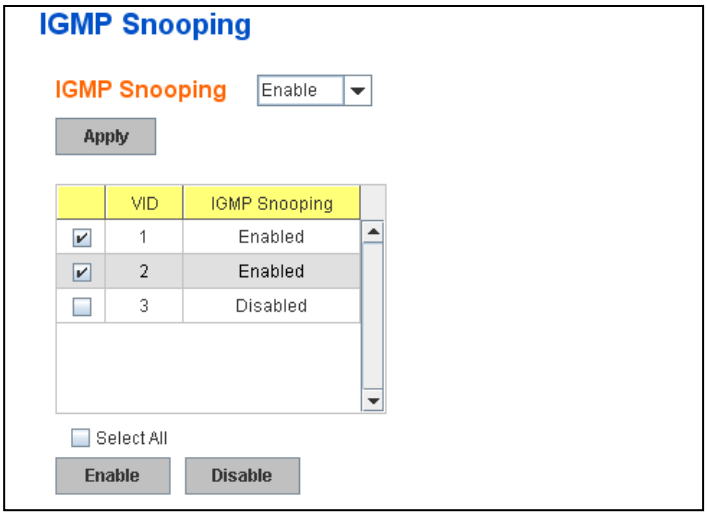
4.8.4 CLI Commands of the Multicast Filtering

4.8.1 IGMP Snooping

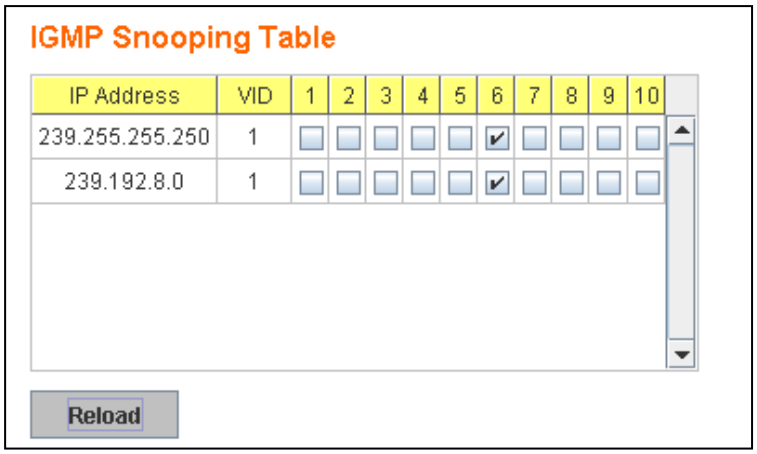
This page is to enable IGMP Snooping feature, assign IGMP Snooping for specific VLAN, and view IGMP Snooping table from dynamic learnt or static manual key-in. the Switch supports IGMP snooping V1/V2/V3 automatically and IGMP query V1/V2.

IGMP Snooping, you can select **Enable** or **Disable** here. After enabling IGMP Snooping, you can then enable IGMP Snooping for specific VLAN. You can enable IGMP Snooping for some VLANs so that some of the VLANs will support IGMP Snooping and others won't.

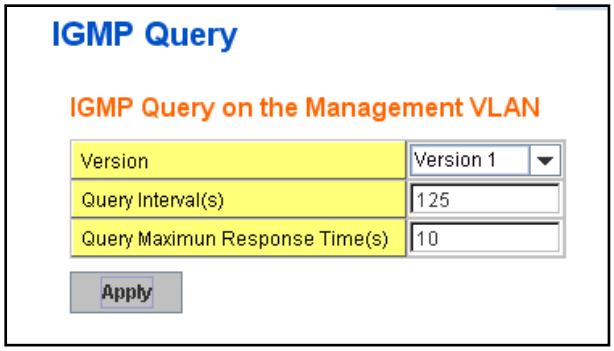
To assign IGMP Snooping to VLAN, please select the **checkbox** of VLAN ID or select "**Select All**" checkbox for all VLANs. Then press **Enable**. In the same way, you can also **Disable** IGMP Snooping for certain VLANs.



IGMP Snooping Table: In the table, you can see multicast group IP address, VLAN ID it belongs to, and member ports of the multicast group. The Switch supports 256 multicast groups. Click on **Reload** to refresh the table.



4.8.2 IGMP Query



This page allows users to configure **IGMP Query** feature. Since the Switch can only be configured by member ports of the management VLAN, IGMP Query can only be enabled on the management VLAN. If you want to run IGMP Snooping feature in several VLANs, you should notice that whether each VLAN has its own IGMP Querier first.

The IGMP querier periodically sends query packets to all end-stations on the LANs or VLANs that are connected to it. For networks with more than one IGMP querier, a switch with the lowest IP address becomes the IGMP querier.

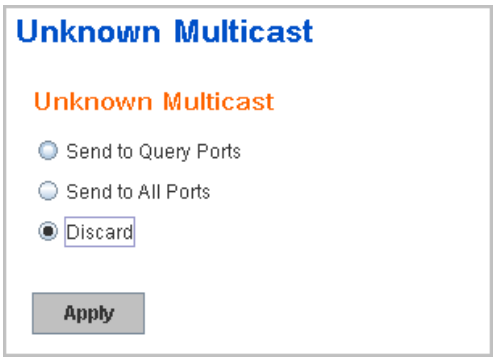
In IGMP Query selection, you can select V1, V2 or Disable. **V1** means IGMP V1 General Query and **V2** means IGMP V2 General Query.. The query will be forwarded to all multicast groups in the VLAN. **Disable** allows you to disable IGMP Query.

Query Interval(s): The period of query sent by querier.

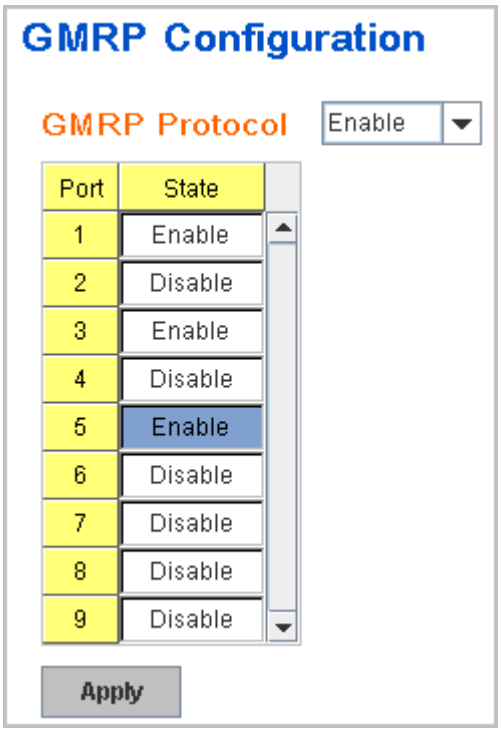
Query Maximum Response Time: The span querier detect to confirm there are no more directly connected group members on a LAN.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.8.3 Unknow Multicasting



The Unknown Multicasting filtering function supports 3 forwarding modes, send to query port, send to all ports and discard.



- **Send to Query Ports:** The device sends the packets with an unknown MAC/IP Multicast address to query ports.
- **Send to All Ports:** The device sends the packets with an unknown MAC/IP Multicast address to all ports.
- **Discard:** The device discards all packets with an unknown MAC/IP Multicast address.

4.8.4 GMRP Configuration

The GARP Multicast Registration Protocol (GMRP) is a Generic Attribute Registration Protocol (GARP) application that provides a constrained multicast flooding facility similar to IGMP snooping.

GMRP provides a mechanism that allows bridges and end stations to dynamically register group membership information with the MAC bridges attached to the same LAN segment and for that information to be disseminated across all bridges in the Bridged LAN that supports extended filtering services. The operation of GMRP relies upon the services provided by the GARP.

- **GMRP Protocol:** Enable/Disable GMRP Protocol.
- **Port:** The number of ports.

- **State:** The state of the GMRP operation on this port. The value enabled indicates that the GMRP is enabled on this port, as long as the GMRP Protocol is also enabled for this device. When disabled, but the GMRP Protocol is still enabled for the device, GMRP is disabled on this port.

Click the **Apply** button to apply the configurations.

4.8.5 CLI Commands of the Multicast Filtering

Command Lines of the multicast filtering configuration

Feature	Command Line
IGMP Snooping	
IGMP Snooping - Global	Switch(config)# ip igmp snooping IGMP snooping is enabled globally. Please specify on which vlans IGMP snooping enables

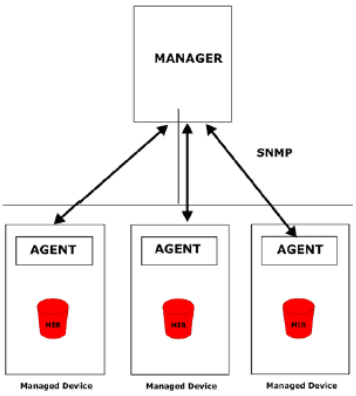
4.9 SNMP



Simple Network Management Protocol (SNMP) is a protocol used for exchanging management information between network devices. SNMP is a member of the TCP/IP protocol suite. The Switch supports SNMP v1 and v2c and V3.

An SNMP managed network consists of two main components: agents and a manager. An agent is a management software module that resides in a managed switch. An agent translates the local management information from the managed device into a SNMP compatible format. The manager is the console through the network.

Following commands are included in this group:

4.9.1 SNMP Configuration

4.9.2 SNMPv3 Profile

4.9.3 SNMP Traps

4.9.4 SNMP CLI Commands for SNMP

4.9.1 SNMP Configuration

This page allows users to configure SNMP V1/V2c Community. The community string can be viewed as the password because SNMP V1/V2c doesn't request you to enter password before you try to access SNMP agent.

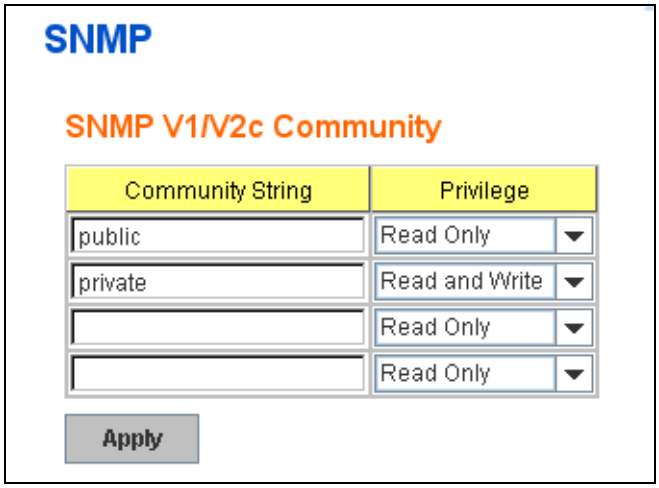
The community includes 2 privileges, Read Only and Read and Write.

With **Read Only** privilege, you only have the ability to read the values of MIB tables. Default community string is Public.

With **Read and Write** privilege, you have the ability to read and set the values of MIB tables. Default community string is Private.

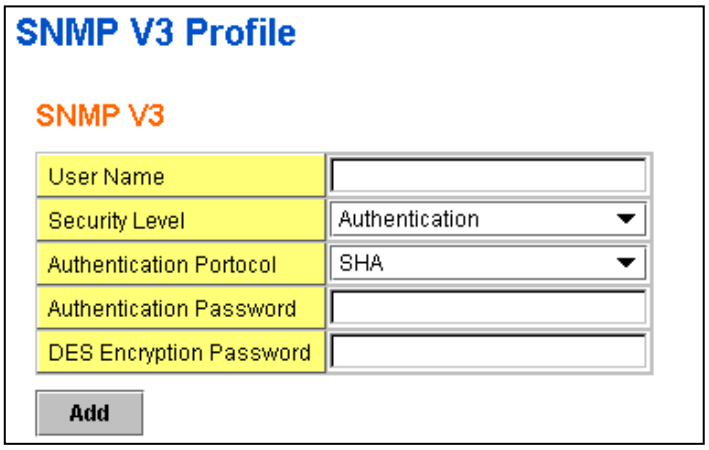
The Switch allows users to assign 4 community strings. Type the community string and select the privilege. Then press **Apply**.

Note: *When you first install the device in your network, we highly recommend you to change the community string. Since most SNMP management application uses Public and Private as their default community name, this might be the leakage of the network security.*



4.9.2 SNMP V3 Profile

SNMP v3 can provide more security functions when the user performs remote management through SNMP protocol. It delivers SNMP information to the administrator with user authentication; all of data between Switch and the administrator are encrypted to ensure secure communication.



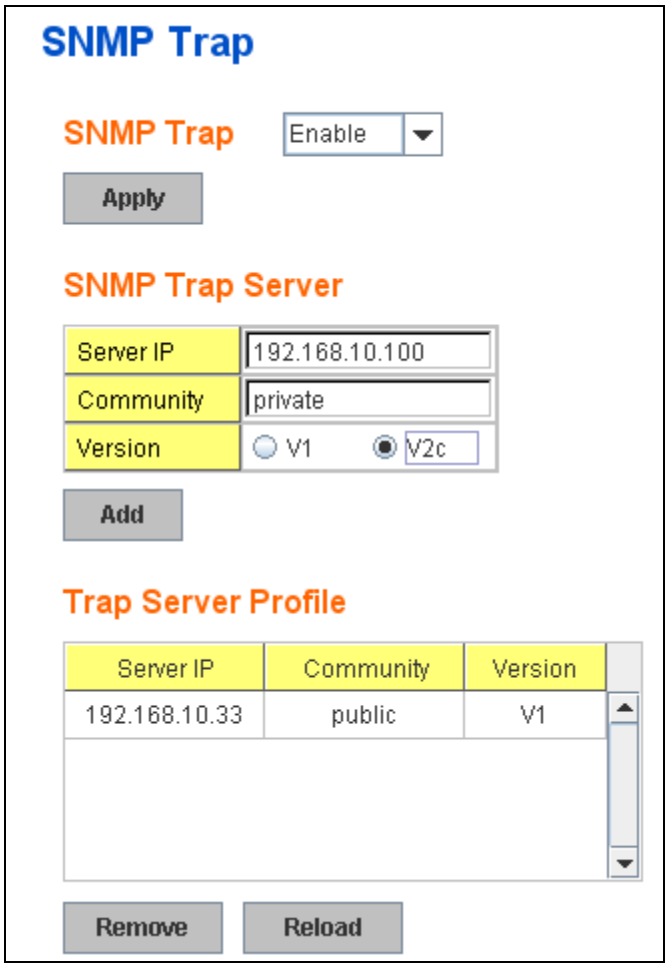
Security Level: Here the user can select the following levels of security: None, User Authentication, and Authentication with privacy.
Authentication Protocol: Here the user can select either MD5 (Message-Digest algorithm 5) or SHA (Secure Hash Algorithm). MD5 is a widely used cryptographic hash function with a 128-bit hash value. SHA (Secure Hash Algorithm) hash functions refer to five Federal Information Processing Standard-approved algorithms for computing a condensed digital representation. The Switch also provides 2 user authentication protocols in MD5 and SHA. You will need to configure SNMP v3 parameters for your SNMP viewer with the same authentication method.

Authentication Password: Here the user enters the SNMP v3 user authentication password.
DES Encryption Password: Here the user enters the password for SNMP v3 user DES Encryption.

4.9.3 SNMP Traps

SNMP Trap is the notification feature defined by SNMP protocol. All the SNMP management applications can understand such trap information. So you don't need to install new application to read the notification information.

This page allows users to **Enable SNMP Trap,** configure the **SNMP Trap server IP**, **Community** name, and trap **Version V1 or V2**. After configuration, you can see the change of the SNMP pre-defined standard traps and Korenix pre-defined traps. The pre-defined traps can be found in Korenix private MIB.



4.9.4 CLI Commands of the SNMP

Command Lines of the SNMP configuration

Feature	Command Line
SNMP Community	
Read Only Community	Switch(config)# snmp-server community public ro community string add ok

Read Write Community	Switch(config)# snmp-server community private rw community string add ok
SNMP Trap	
Enable Trap	Switch(config)# snmp-server enable trap Set SNMP trap enable ok.
SNMP Trap Server IP without specific community name	Switch(config)# snmp-server host 192.168.10.33 SNMP trap host add OK.
SNMP Trap Server IP with version 1 and community	Switch(config)# snmp-server host 192.168.10.33 version 1 private SNMP trap host add OK. ***Note: private is the community name, version 1 is the SNMP version***
SNMP Trap Server IP with version 2 and community	Switch(config)# snmp-server host 192.168.10.33 version 2 private SNMP trap host add OK.
Disable SNMP Trap	Switch(config)# no snmp-server enable trap Set SNMP trap disable ok.
Display	Switch# sh snmp-server trap SNMP trap: Enabled SNMP trap community: public Switch# show running-config ..... snmp-server community public ro snmp-server community private rw snmp-server enable trap snmp-server host 192.168.10.33 version 2 admin snmp-server host 192.168.10.33 version 1 admin ……..

4.10 Security

The Switch provides several security features for you to secure your connection. The features include Port Security and IP Security.

Following commands are included in this group:

4.10.1 Port Security

4.10.2 IP Security

4.10.3 IEEE 802.1x

4.10.4 CLI Commands of the Security

4.10.1 Port Security

Port Security feature allows you to stop the MAC address learning for specific port. After stopping MAC learning, only the MAC address listed in Port Security List can access the switch and transmit/receive traffic. This is a simple way to secure your network environment and not to be accessed by hackers.

This page allows you to enable Port Security and configure Port Security entry.

Port Security State: Change Port Security State of the port to enable first.

Add Port Security Entry: Select the port, and type VID and MAC address. Format of the MAC address is xxxx.xxxx.xxxx. Ex: 0012.7701.0101. Max volume of one port is 10. So the system can accept 100 Port Security MAC addresses in total.

Port Security List: This table shows you those enabled port security entries. You can click on **Remove** to delete the entry.

Once you finish configuring the settings, click on **Apply / Add** to apply your configuration.

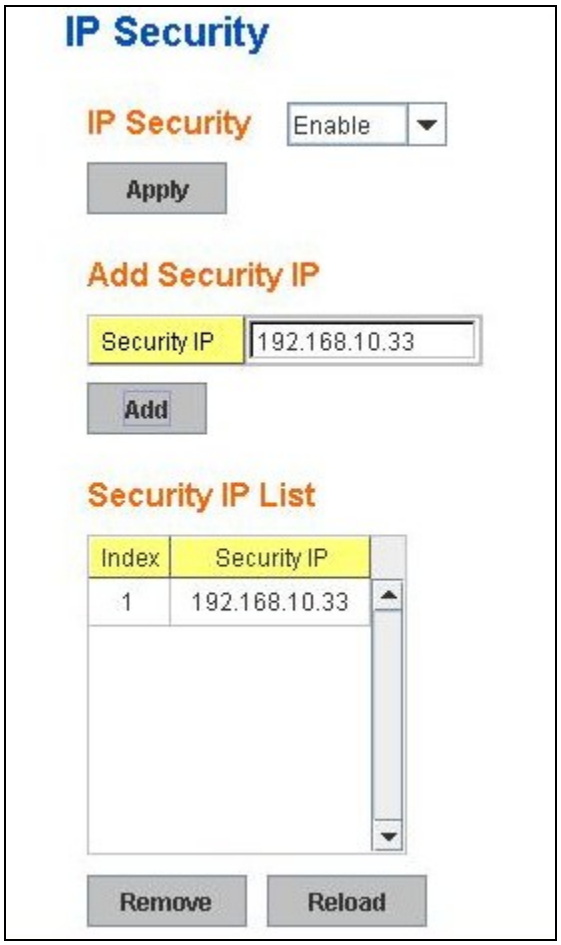
4.10.2 IP Security

In IP Security section, you can set up specific IP addresses to grant authorization for management access to this JetNet via a web browser or Telnet.

IP Security: Select Enable and **Apply** to enable IP security function.

Add Security IP: You can assign specific IP addresses, and then press **Add**. Only these IP addresses can access and manage JetNet via a web browser or Telnet. Max security IP is 10.

Security IP List: This table shows you added security IP addresses. You can press **Remove** to delete, **Reload** to reload the table.

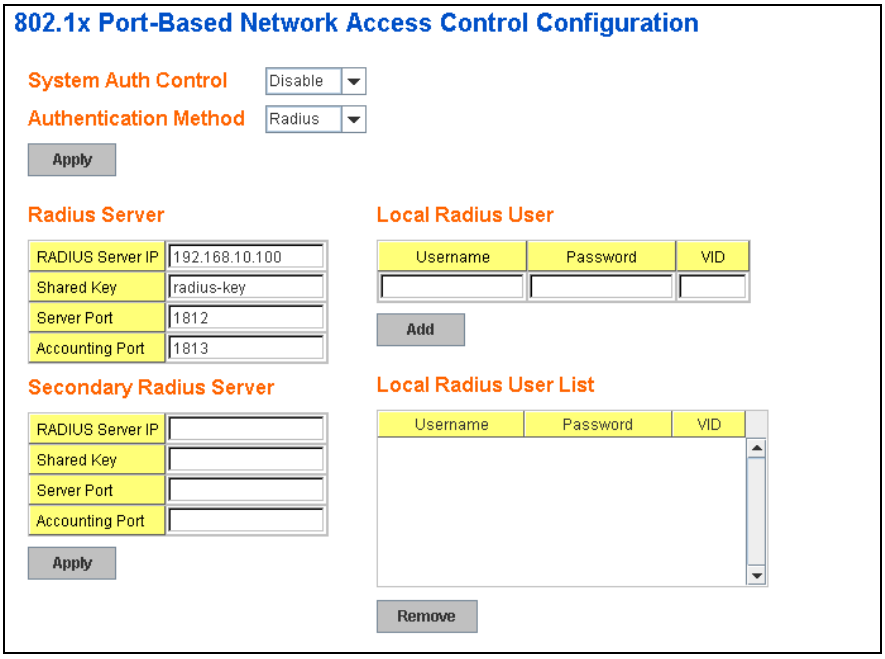


Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.10.3 802.1x

802.1x Configuration

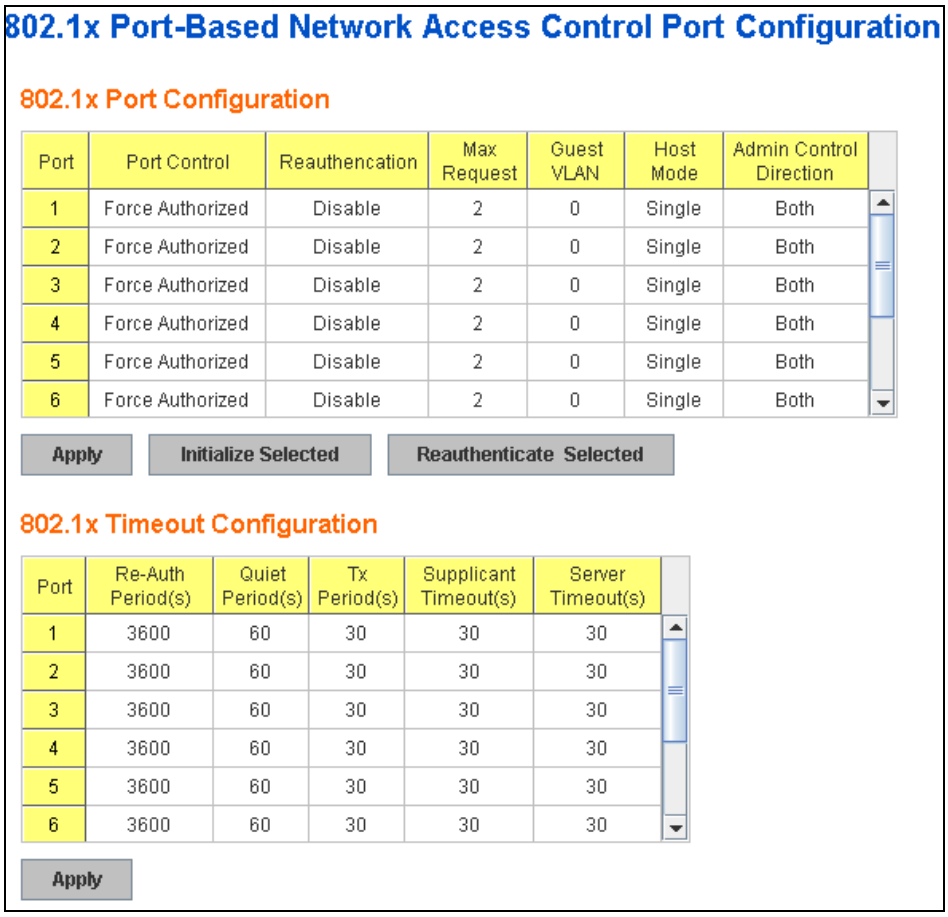
IEEE 802.1X is the protocol that performing authentication to obtain access to IEEE 802 LANs. It is port-base network access control. With the function, Switch could control which connection is available or not.



System AuthControl: To enable or disable the 802.1x authentication.
Authentication Method: Radius is an authentication server that provide key for authentication, with this method, user must connect switch to server. If user select Local for the authentication method, switch use the local user data base which can be create in this page for authentication.
Radius Server IP: The IP address of Radius server
Shared Key: the password for communicate between switch and Radius-Server.
Server Port: UDP port of Radius server.
Accounting Port: Port for packets that contain the information of account login or logout.
Secondary Radius Server IP: Secondary Radius Server could be set in case of the primary radius server down.
802.1X Local User: Here User can add Account/Password for local authentication.
802.1X Local user List: This is a list shows the account information, User also can remove selected account Here.

802.1x Port Configuration

After the configuration of Radius Server or Local user list, user also need configure the authentication mode, authentication behavior, applied VLAN for each port and permitted communication. The following information will explain the port configuration.



Port control: Force Authorized means this port is authorized; the data is free to in/out. Force unauthorized just opposite, the port is blocked. If users want to control this port with Radius Server, please select Auto for port control.

Reauthentication: If enable this field, switch will ask client to re-authenticate. The default time interval is 3600 seconds.

Max Request: the maximum times that the switch allow client request.

Guest VLAN: 0 to 4094 is available for this field. If this field is set to 0, that means the port is blocked after authentication fail. Otherwise, the port will be set to Guest VLAN.

Host Mode: if there are more than one device connected to this port, set the Host Mode to single means only the first PC authenticate success can access this port. If this port is set to multi, all the devices can access this port once any one of them pass the authentication.

Control Direction: determined devices can end data out only or both send and receive.

Re-Auth Period: control the Re-authentication time interval, available

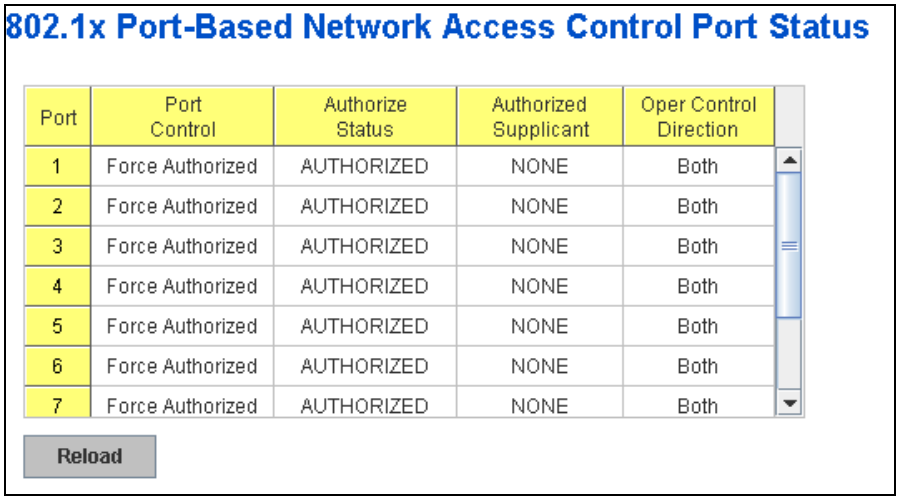
number is 1~65535.
Quiet Period: When authentication failed, Switch will wait for a period and try to communicate with radius server again.
Tx period: the time interval of authentication request.
Supplicant Timeout: the timeout for the client authenticating
Sever Timeout: The timeout for server response for authenticating.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

Click **Initialize Selected** to set the authorize state of selected port to initialize status.
Click **Reauthenticate Selected** to send EAP Request to supplicant to request reauthentication.
Click **Default Selected** to reset the configurable 802.1x parameters of selected port to the default values.

802.1X Port Status

Here user can observe the port status for Port control status, Authorize Status, Authorized Supplicant and Oper Control Direction each port.



4.10.4 CLI Commands of the Security

Command Lines of the Security configuration

Feature	Command Line
Port Security	
Add MAC	Switch(config)# mac-address-table static 0012.7701.0101 vlan 1 interface fa1 mac-address-table unicast static set ok!
Port Security	Switch(config)# interface fa1 Switch(config-if)# switchport port-security Disables new MAC addresses learning and aging activities! ***Note: Rule: Add the static MAC, VLAN and Port binding first,***

	then enable the port security to stop new MAC learning.
Disable Port Security	Switch(config-if)# no switchport port-security Enable new MAC addresses learning and aging activities!
Display	Switch# show mac-address-table static Destination Address Address Type Vlan Destination Port ---------- ---------- ------- ---------- 0012.7701.0101 Static 1 fa1

radius secondary-server-ip	Switch(config)# dot1x radius secondary-server-ip 192.168.10.250 key 5678 Port number NOT given. (default=1812) RADIUS Accounting Port number NOT given. (default=1813)

	Secondary RADIUS Server IP : 192.168.10.250 Secondary RADIUS Server Key : 5678 Secondary RADIUS Server Port : 1812 Secondary RADIUS Accounting Port : 1813
User name/password for authentication	Switch(config)# dot1x username korenix passwd korenix vlan 1

4.11 Warning

The Switch provides several types of Warning features for you to remote monitor the status of end devices or the change of your network. The features include Fault Relay, System Log and SMTP E-mail Alert.

Following commands are included in this group:

4.11.1 Fault Relay

4.11.2 Event Selection

4.11.3 Syslog Configuration

4.11.4 SMTP Configuration

4.11.5 CLI Commands

4.11.1 Fault Relay

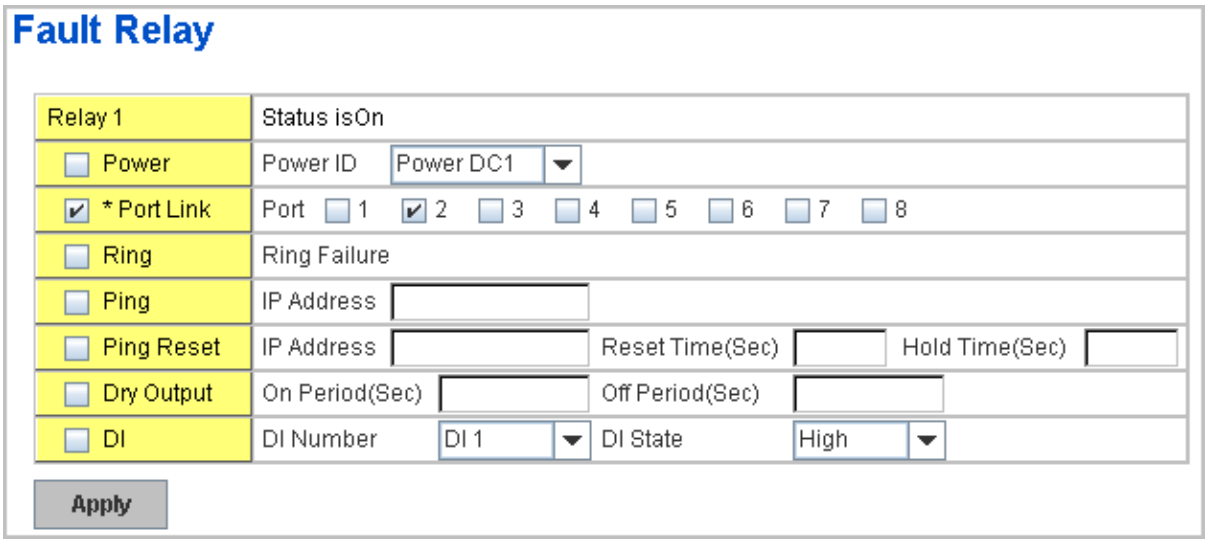
The Switch provides 1 digital output, also known as Relay Output. The relay contacts are energized (open) for Switch normal operation and will close under Switch's fault conditions. The fault conditions include be DI State change, Periodical On/Off, Switch's Power Failure, Ethernet port Link Failure, Ping Failure and Super Ring Topology Change. You can configure these settings in this Fault Relay Setting. Each Relay can be assigned 1 fault condition.

From the firmware version 1.2, the fault relay supports multiple event relay binding function. That means fault realy not only support one event only, it can be assigned multiple event. The condition or term described as following.

Term	conditction	description
Power	Power DC1 Power DC2 Any	Detect power input status. If one of condiction occurred, relay triggered.
Port Link	Port number	Monitoring port link down event
Ring	Ring failure	If ring topology changed
Ping	**IP Address:** remote device's IP address.	If target IP does not reply ping request, then relay active.
Ping Reset	**IP address:** remote device's address **Reset Time**: duration of output open. **Hodl Time:** duration of Ping hold time.	Ping target device and trigger relay to emulate power reset for remote device, if remote system crash. Note: once perform Ping, and then reset. The relay output will form a short circuit to active as a power switch.
Dry Output	**On period:** duration of relay output short (close). **Off period**: duration of relay output open.	Relay continuous perform On/Off behavior with different duration.
DI	DI number	Relay trigger when DI states change to Hi

	(the Switch only supports one Digital Input)	or Low

The Fault relay configuration UI has shown as below:



Relay 1: Show current relay state. If the relay is triggered, the event type will be marked with the symbol- *. On the upper diagram, the replay is triggerd by port event – port 2 link down.

Power: relay trigger by power down event. It can be set to minotoring power DC1, DC2 and both.

Port Link: monitoring the port link status.

Ring: monitoring the ring status.

Ping: ping predefined IP address. If the deivce does not reply the Ping, the relay will be triggered.

Ping Reset: the relay active as a power switch for remote device. If the relay alarm function is occupied for the Ping Reset, the other event should be disabled. It may cause the relay wrong action.

IP address: device's IPaddress whose power wiring is connected with relay output.

Reset Time: user defined duration of relay contact open to emulate power switch off. After the duration, the relay contact will change to close to emulates power switch on.

Hold time: user defined the booting time that deivce needed. After relay contact close, the Switch will start ping after count down the hold time.

Dry Output: dorced the relay active as an on/off switch. This function also should not apply with other event.

On period /Off period: the duration of relay on and off. The available

range of a period is 0-65535 seconds

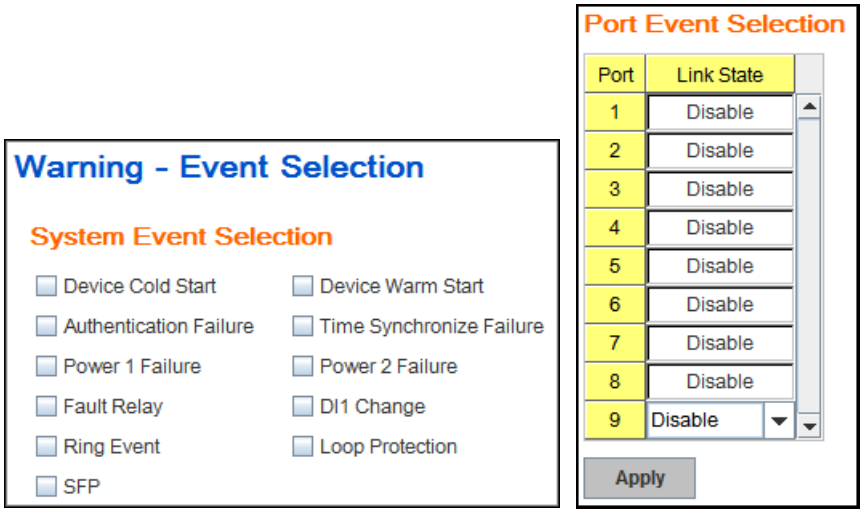
DI: monitoring the Digital input state.

4.11.2 Event Selection

Event Types can be divided into two basic groups: System Events and Port Events. System Events are related to the overall function of the switch, whereas Port Events related to the activity of specific ports

System Event	Warning Event is sent when…..
Device Cold Start	Power is cut off and then reconnected.
Device Warm Start	Reboot the device by CLI or Web UI.
Power 1 /2 Failure	Power 1 or 2 is failure.
Authentication failure	An incorrect password, SNMP Community String is entered.
Time Synchronize Failure	Accessing to NTP Server is failure.
Fault Relay	The DO/Fault Relay is on.
Ring Event	Master of Super Ring has changed or backup path is activated.
DI1 Change	The Digital Input#1 status is changed.
Loop Protection	Looping event occurred.
SFP	The readed information of DDM SFP transceiver is over temperature or out the range of TX/RX power.
Port Event	**Warning Event is sent when…..**
Link-Up	The port is connected to another device
Link-Down	The port is disconnected (e.g. the cable is pulled out, or the opposing devices turns down)
Both	The link status changed.

The uer interface shown as below captured figure.



Click on the select box to enable /disable the system event, and choice the port event type for monitoring, and then click the icon “**Apply**” to activate the monitoring functions.

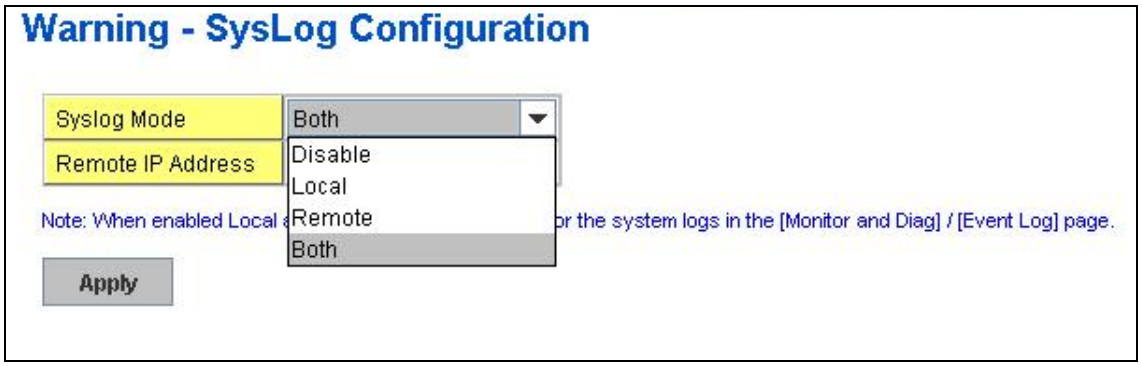
4.11.3 SysLog Configuration

System Log is useful to provide system administrator locally or remotely monitor switch events history. There are 2 System Log modes provided by Switch, local mode and remote mode.

Local Mode: In this mode, the Switch will print the occurred events selected in the Event Selection page to System Log table of Switch. You can monitor the system logs in [Monitor and Diag] / [Event Log] page.

Remote Mode: The remote mode is also known as Server mode in JetNet series. In this mode, you should assign the IP address of the System Log server. The Switch will send the occurred events selected in Event Selection page to System Log server you assigned.

Both: Above 2 modes can be enabled at the same time.



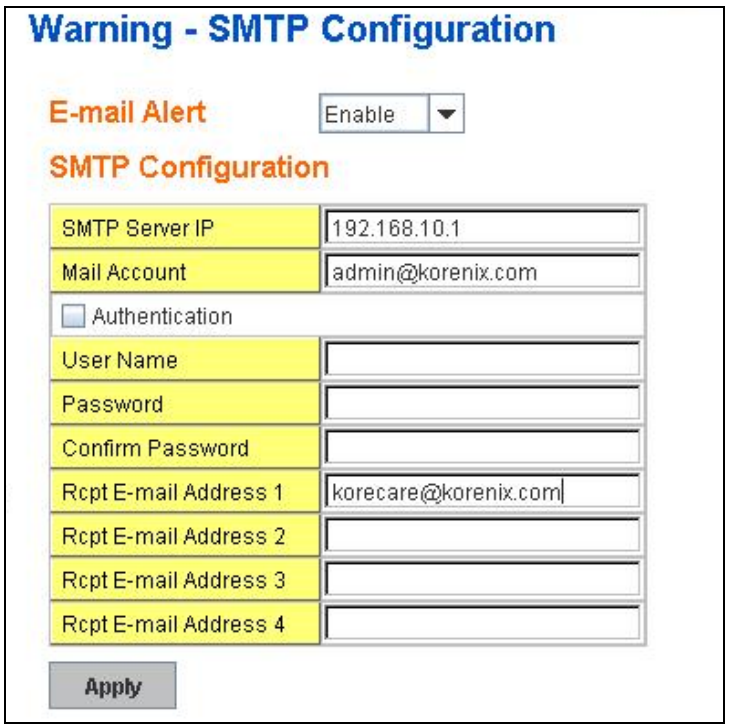
Once you finish configuring the settings, click on **Apply** to apply your configuration.

Note: *When enabling Local or Both modes, you can monitor the system logs in [Monitor and Diag] / [Event Log] page.*

4.11.4 SMTP Configuration

The Switch supports E-mail Warning feature. The switch will send the occurred events to remote E-mail server. The receiver can then receive notification by E-mail. The E-mail warning is conformed to SMTP standard.

This page allows you to enable E-mail Alert, assign the SMTP Server IP, Sender E-mail, and Receiver E-mail. If SMTP server requests you to authorize first, you can also set up the username and password in this page.



Field	Description
SMTP Server IP Address	Enter the IP address of the email Server
Authentication	Click on check box to enable password
User Name	Enter email Account name (Max.40 characters)
Password	Enter the password of the email account
Confirm Password	Re-type the password of the email account
You can set up to 4 email addresses to receive email alarm from JetNet	
Rcpt E-mail Address 1	The first email address to receive email alert from JetNet (Max. 40 characters)
Rcpt E-mail Address 2	The second email address to receive email alert from JetNet (Max. 40 characters)
Rcpt E-mail Address 3	The third email address to receive email alert from JetNet (Max. 40 characters)
Rcpt E-mail Address 4	The fourth email address to receive email alert from JetNet (Max. 40 characters)

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.11.5 CLI Commands

Command Lines of the Warning configuration

Feature	Command Line
Relay Output	
Relay Output	Switch(config)# relay 1 di DI state dry dry output ping ping failure port port link failure power power failure ring super ring failure ***Note: Select Relay 1 or 2 first, and then select the event types.***
DI State	Switch(config)# relay 1 di <1-2> DI number Switch(config)# relay 1 di 1 high high is abnormal low low is abnormal Switch(config)# relay 1 di 1 high
Dry Output	Switch(config)# relay 1 dry <0-4294967295> turn on period in second Switch(config)# relay 1 dry 5 <0-4294967295> turn off period in second Switch(config)# relay 1 dry 5 5
Ping Failure	Switch(config)# relay 1 ping 192.168.10.33 <cr> reset reset a device Switch(config)# relay 1 ping 192.168.10.33 reset <1-65535> reset time Switch(config)# relay 1 ping 192.168.10.33 reset 60 <0-65535> hold time to retry Switch(config)# relay 1 ping 192.168.10.33 reset 60 60
Port Link Failure	Switch(config)# relay 1 port PORTLIST port list Switch(config)# relay 1 port fa1-5
Power Failure	Switch(config)# relay 1 power <1-2> power id Switch(config)# relay 1 power 1 Switch(config)# relay 1 power 2
Super Ring Failure	Switch(config)# relay 1 ring
Disable Relay	Switch(config)# no relay <1-2> relay id Switch(config)# no relay 1 *(Relay_ID: 1 or 2 (2nd Relay)* <cr>
Display	Switch# show relay 1 Relay Output Type : Port Link Port : 1, 2, 3, 4,
Event Selection	
Event Selection	Switch(config)# warning-event coldstart Switch cold start event

	warmstart Switch warm start event linkdown Switch link down event linkup Switch link up event all Switch all event authentication Authentication failure event di Switch di event fault-relay Switch fault relay event power Switch power failure event sfp-ddm Switch SFP DDM abnormal event super-ring Switch super ring topology change event time-sync Switch time synchronize event
Ex: Cold Start event	Switch(config)# warning-event coldstart Set cold start event enable ok.
Ex: Link Up event	Switch(config)# warning-event linkup [IFNAME] Interface name, ex: fastethernet1 or gi8 Switch(config)# warning-event linkup gi5 Set gi5 link up event enable ok.
Display	Switch# show warning-event Warning Event: Cold Start: Enabled Warm Start: Disabled Authentication Failure: Disabled Link Down: gi4-5 Link Up: gi4-5 Power Failure: Super Ring Topology Change: Disabled Fault Relay: Disabled Time synchronize Failure: Disable SFP DDM: Enabled DI:DI1
Syslog Configuration	
Local Mode	Switch(config)# log syslog local
Server Mode	Switch(config)# log syslog remote 192.168.10.33
Both	Switch(config)# log syslog local Switch(config)# log syslog remote 192.168.10.33
Disable	Switch(config)# no log syslog local
SMTP Configuration	
SMTP Enable	Switch(config)# smtp-server enable email-alert SMTP Email Alert set enable ok.
Sender mail	Switch(config)# smtp-server server 192.168.10.100 ACCOUNT SMTP server mail account, ex: admin@korenix.com Switch(config)# smtp-server server 192.168.10.100 admin@korenix.com SMTP Email Alert set Server: 192.168.10.100, Account: admin@korenix.com ok.
Receiver mail	Switch(config)# smtp-server receipt 1 korecare@korenix.com SMTP Email Alert set receipt 1: korecare@korenix.com ok.
Authentication with username and password	Switch(config)# smtp-server authentication username admin password admin SMTP Email Alert set authentication Username: admin, Password: admin ***Note: You can assign string to username and password.***
Disable SMTP	Switch(config)# no smtp-server enable email-alert SMTP Email Alert set disable ok.

Disable Authentication	Switch(config)# no smtp-server authentication SMTP Email Alert set Authentication disable ok.
Dispaly	Switch# sh smtp-server SMTP Email Alert is Enabled Server: 192.168.10.100, Account: admin@korenix.com Authentication: Enabled Username: admin, Password: admin SMTP Email Alert Receipt: Receipt 1: korecare@korenix.com Receipt 2: Receipt 3: Receipt 4:

4.12 Monitor and Diag

The Switch provides several types of features for you to monitor the status of the switch or diagnostic for you to check the problem when encountering problems related to the switch. The features include MAC Address Table, Port Statistics, Port Mirror, Event Log and Ping.

Following commands are included in this group:

4.12.1 MAC Address Table

4.12.2 Port Statistics

4.12.3 Port Mirror

4.12.4 Event Log

4.12.5 Topology Discovery

4.12.5 Ping

4.12.6 CLI Commands of the Monitor and Diag

4.12.1 MAC Address Table

The Switch provides 8K entries in MAC Address Table. In this page, users can change the Aging time, add Static Unicast MAC Address, monitor the MAC address or sort them by different packet types and ports. Click on **Apply** to change the value.

Aging Time (Sec)
Each switch fabric has limit size to write the learnt MAC address. To save more entries for new MAC address, the switch fabric will age out non-used MAC address entry per Aging Time timeout. The default Aging Time is 300 seconds. The Aging Time can be modified in this page.

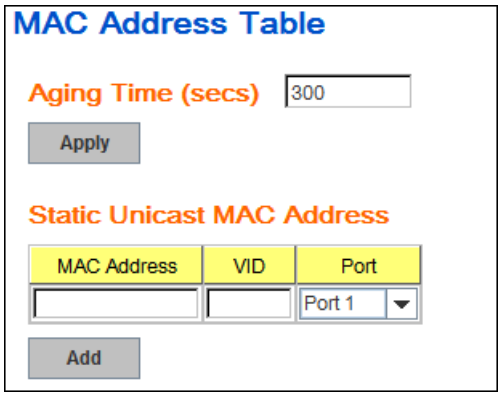
Static Unicast MAC Address
In some applications, users may need to type in the static Unicast MAC address to its MAC address table. In this page, you can type MAC Address (format: xxxx.xxxx.xxxx), select its VID and Port ID, and then click on **Add** to add it to MAC Address table.

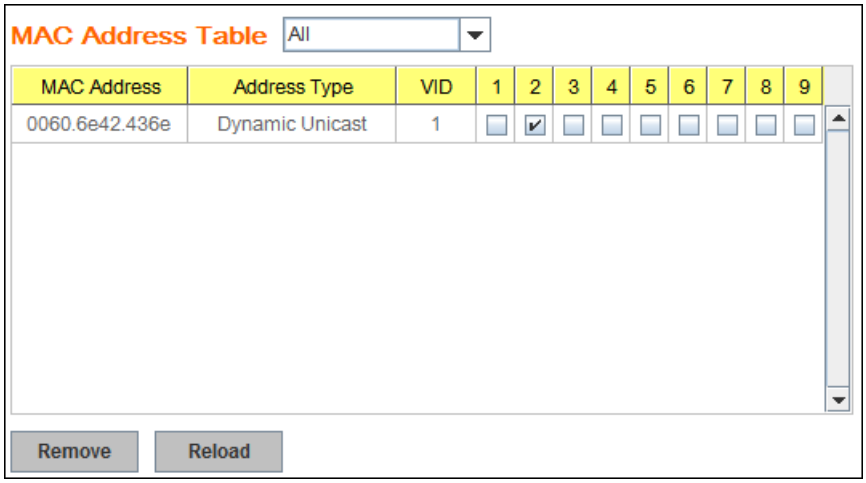
MAC Address Table

In this MAC Address Table, you can see all the MAC Addresses learnt by the switch fabric. The packet types include Management Unicast, Static Unicast, Dynamic Unicast, Static Multicast and Dynamic Multicast. The table allows users to sort the address by the packet types and port.

Packet Types: Management Unicast means MAC address of the switch. It belongs to CPU port only. **Static Unicast** MAC address can be added and deleted. **Dynamic Unicast** MAC is MAC address learnt by the switch Fabric. **Static Multicast** can be added by CLI and can be deleted by Web and CLI. **Dynamic Multicast** will appear after you enabled IGMP and the switch learnt IGMP report.

Click on **Remove** to remove the static Unicast/Multicast MAC address. Click on **Reload** to refresh the table. New learnt Unicast/Multicast MAC address will be updated to MAC address table.



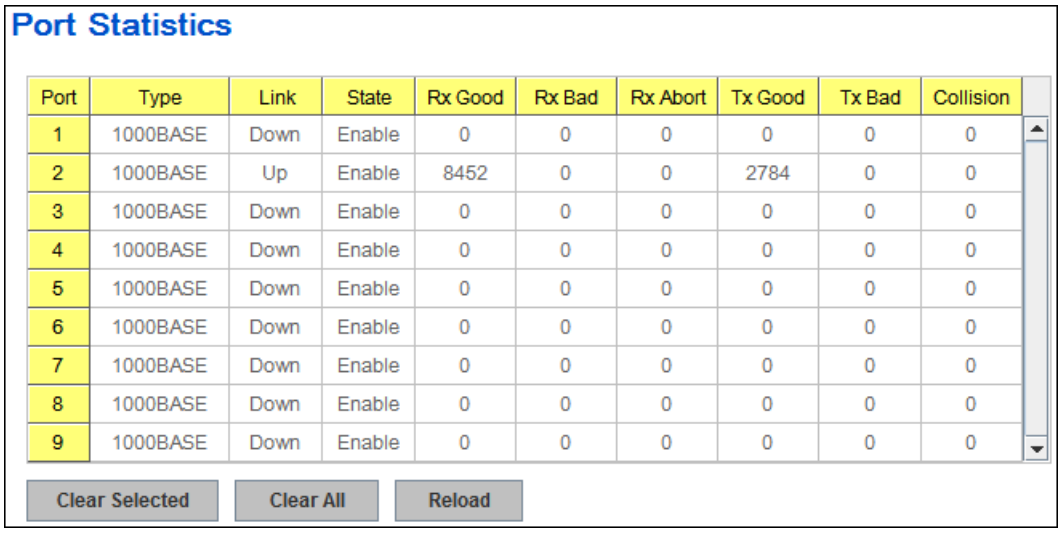


4.12.2 Port Statistics

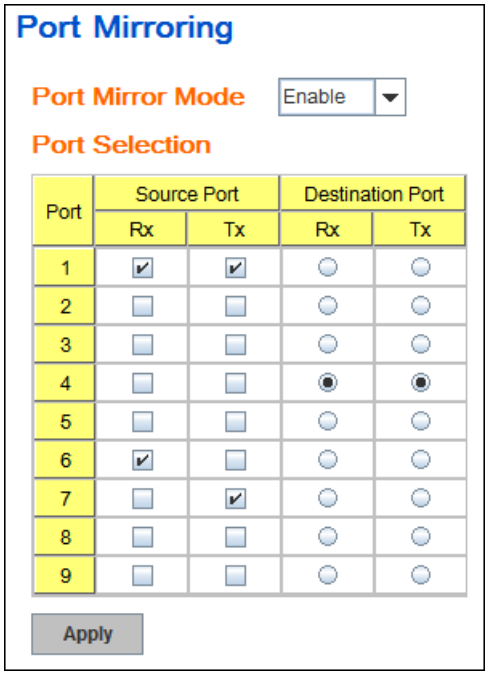
In this page, you can view operation statistics for each port. The statistics that can be viewed include Link Type, Link State, Rx Good, Rx Bad, Rx Abort, Tx Good, Tx Bad and Collision. Rx means the received packet while Tx means the transmitted packets.

Note: If you see many Bad, Abort or Collision counts increased, that may mean your network cable is not connected well, the network performance of the port is poor…etc. Please check your network cable, Network Interface Card of the connected device, the network application, or reallocate the network traffic…etc.

Click on **Clear Selected** to reinitialize the counts of the selected ports, and **Clear All** to reinitialize the counts of all ports. Click on **Reload** to refresh the counts.



4.12.3 Port Mirroring



Port mirroring (also called port spanning) is a tool that allows you to mirror the traffic from one or more ports onto another port, without disrupting the flow of traffic on the original port. Any traffic that goes into or out of the Source Port(s) will be duplicated at the Destination Port. This traffic can then be analyzed at the Destination port using a monitoring device or application. A network administrator will typically utilize this tool for diagnostics, debugging, or fending off attacks.

Port Mirror Mode: Select Enable/Disable to enable/disable Port Mirror.

Source Port: This is also known as Monitor Port. These are the ports you want to monitor. The traffic of all source/monitor ports will be copied to destination/analysis ports. You can choose a single port, or any combination of ports, but you can only monitor them in Rx or TX only. Click on checkbox of the Port ID, RX, Tx or Both to select the source ports.

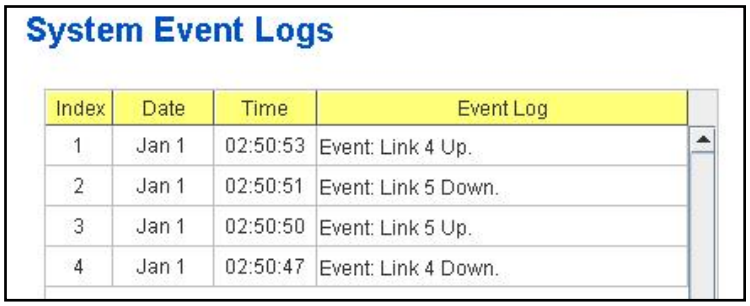
Destination Port: This is also known as Analysis Port. You can analyze the traffic of all the monitored ports at this port without affecting the flow of traffic on the port(s) being monitored. Only one RX/TX of the destination port can be selected. A network administrator would typically connect a LAN analyzer or Netxray device to this port.

Once you finish configuring the settings, click on **Apply** to apply the settings.

4.12.4 Event Log

In the 4.10.3, we have introduced System Log feature. When System Log Local mode is selected, the Switch will record occurred events in local log table. This page shows this log table. The entry includes the index, occurred data and time and content of the events.

Click on "**Clear"** to clear the entries. Click on "**Reload"** to refresh the table.



4.12.5 Topology Discovery

The managed Switch supports topology discovery or LLDP (IEEE 802.1AB Link Layer Discovery Protocol) function that can help user to discovery multi-vendor's network devices on same segment by NMS system which supports LLDP function; With LLDP function, NMS can easier maintain the topology map, display port ID, port description, system description, VLAN ID… Once the link failure, the topology change events can be updated to the NMS as well. The LLDP Port State can display the neighbor ID and IP leant from the connected devices.

LLDP: Select Enable/Disable to enable/disable LLDP function.

LLDP Configuration: To configure the related timer of LLDP.

LLDP Timer: the interval time of each LLDP and counts in second; the valid number is from 5 to 254, default is 30 seconds.

LLDP Hold time: The TTL (Time To Live) timer. The LLDP state will be expired once the LLDP is not received by the hold time. The default is 120 seconds.

Local port: the current port number that linked with neighbor network device.

Neighbor ID: the MAC address of neighbor device on the same network segment.

Neighbor IP: the IP address of neighbor device on the same network segment.

Neighbor VID: the VLAN ID of neighbor device on the same network

segment.

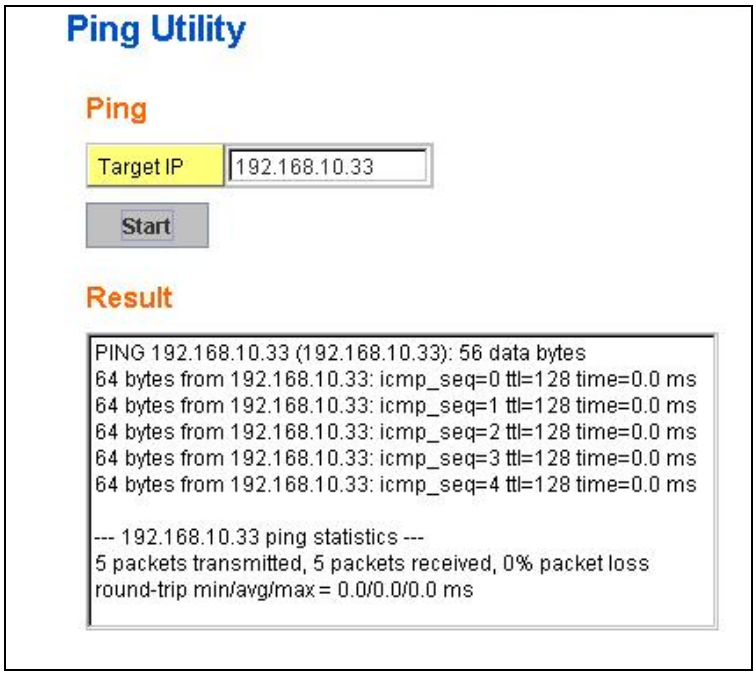
4.12.6 Ping Utility

This page provides **Ping Utility** for users to ping remote device and check whether the device is alive or not. Type **Target IP** address of the target device and click on **Start** to start the ping. After few seconds, you can see the result in the **Result** field.



4.12.7 CLI Commands of the Monitor and Diag

Command Lines of the Monitor and Diag configuration

Feature	Command Line
MAC Address Table	
Ageing Time	Switch(config)# mac-address-table aging-time 350 mac-address-table aging-time set ok! *Note: 350 is the new ageing timeout value.*

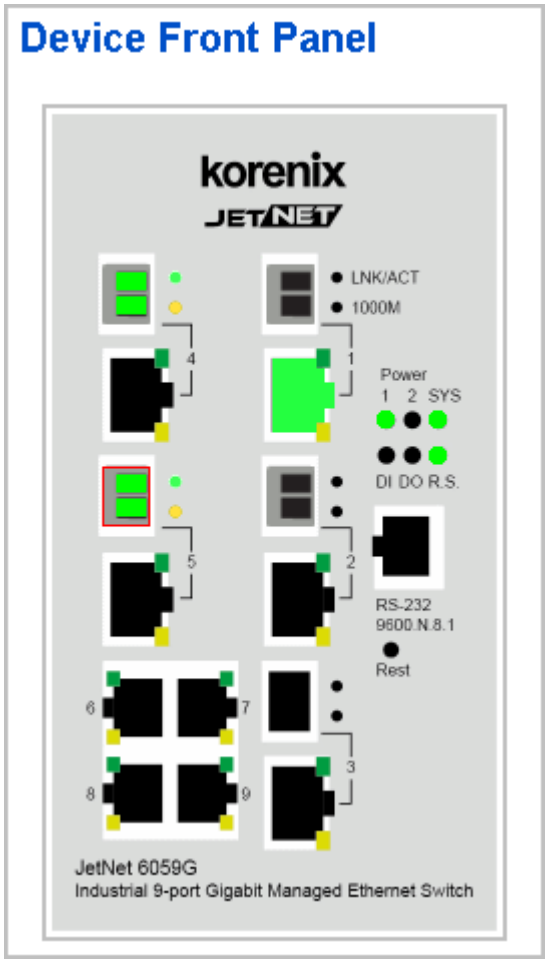
4.12 Device Front Panel

Device Front Panel command allows you to see LED status of the switch. You can see LED and link status of the Power, DO, DI, R.M. and Ports.

Feature	On / Link UP	Off / Link Down	Other
Power	Green	Black	
Digital Output	Green	Black	
Digital Input	Green	Black	
R.M.(Ring Master)	Green	Black	
Fast Ethernet	Green	Black	
Gigabit Ethernet	Green	Black	
SFP	Green	Black	Gray: Plugged but not link up yet.



Note: No CLI command for this feature.

4.13 Save to Flash

Save Configuration allows you to save any configuration you just made to the Flash. Powering off the switch without clicking on **Save Configuration** will cause loss of new settings. After selecting **Save Configuration**, click on **Save to Flash** to save your new configuration.

Command Lines:

Feature	Command Line
Save	SWITCH# write Building Configuration… [OK] Switch# copy running-config startup-config Building Configuration... [OK]

4.14 Logout

The switch provides 2 logout methods. The web connection will be logged out if you don't input any command after 30 seconds. The Logout command allows you to manually logout the web connection. Click on **Yes** to logout, **No** to go back the configuration page.

Command Lines:

Feature	Command Line
Logout	SWITCH> exit SWITCH# exit

5 Appendix

5.1 Product Specifications.

Technology	
Standard	IEEE 802.3 10Base-T Ethernet IEEE 802.3u 100Base-TX Fast Ethernet IEEE 802.3u 100Base-FX Fast Ethernet Fiber IEEE 802.3ab 1000Base-T IEEE 802.3z Gigabit Fiber IEEE 802.3x Flow Control and Back-pressure IEEE 802.1AB Link Layer Discovery Protocol (LLDP) IEEE 802.1p Class of Service (CoS) IEEE 802.1Q VLAN and GVRP IEEE 802.1D-2004 Rapid Spanning Tree Protocol (RSTP) IEEE 802.3ad Link Aggregation Protocol (LACP) IEEE 802.1x Port Based Network Access Protocol IEEE 1588 Precision Time Protocol (PTP)
System Performance	
Switch Technology	Store and Forward Technology with 32Gbps Switch Fabric.
System Throughput	26 Mega packets per second, 64 bytes packet size. 14880 pps for 10Base-T 148810 pps for 100Base-TX/FX 1488100 pps for 1000Base-T/ Gigabit fiber Maximum packet size up to 1632bytes
CPU performance	32 bits ARM-9E running at 180 Mhz and performance up to 200MIPS; Embedded hardware based watch-dog timer.
System Memory	8M bytes flash ROM, 64M bytes SDRAM.
Transfer packet size	64 bytes to 1632 bytes (includes 1522 bytes VLAN Tag).
MAC Address	8K MAC address table.
Packet Buffer	1M bits shared memory for packet buffer.
Transfer performance	14,880pps for Ethernet and 148,800 for Fast Ethernet, 1488,100 for Gigabit Ethernet
Thermal Monitoring	Embedded board-level thermal detector for main-chip temperature monitoring.
Relay Alarm	Dry Relay output with 1A /24V DC or 0.5A/125V AC ability. The

	Alarm relay output (DO) supports multiple events binding function.
Digital Input (DI)	One Digital Input with Photo Copular isolation Digital Hi: DC 11V~30V Digital Low: DC 10V~0V
System Management	
Configuration and monitoring interface	Supports 4 configuration and monitoring interfaces: **RS-232** serial port, **Telnet**, **SNMP** and build in Web server for user management through the Web browser, and also supports **HTTPS** with **SSL/ TLS** for secure Web management. The RS-232 and Telnet interfaces support Cisco like instructions
System upgrade/Backup	Provides TFTP/Web interface for firmware upgrade and configuration backup, restore
Telnet & Local Console	Supports command line interface with Cisco like commands and maximum 4 sessions; the telnet interface also supports **SSH** (Security Shell) to secure telnet communication.
SNMP	Supports v1, v2c, V3 with SNMP trap function, trap station up to 4 and can be manually configured the trap server IP address
SNMP MIB	MIBII, Bridge MIB, Ethernet-like MIB, VLAN MIB, IGMP MIB, Korenix Private MIB
Korenix Utility	Supports JetView and JetView Pro with **IEEE 802.1AB** Link Layer Discovery Protocol (**LLDP**)for device finding and link topology discovery
Network Time Protocol	Supports NTP protocol with daylight saving function and localize time sync function.
Management IP Security	IP address security to prevent unauthorized access
E-mail Warning	4 receipt E-mail accounts with mail server authentication
System Log	Supports both Local or remote Server with authentication
Network Performance	
IEEE 802.3x	Flow control pause frame supports on 10/100/1000Mbps Full Duplex and Back-pressure supports on 1000Mbps Half Duplex only
Port Configuration	Port link Speed, Link mode, current status and enable/disable
Port Trunk	IEEE 802.3ad port aggregation and static port trunk; trunk member up to 4 ports and maximum 4 trunk groups include Gigabit Ethernet port
VLAN	IEEE 802.1Q Tag VLAN with 256 VLAN Entries and provides 2K GVRP entries

	3 VLAN link modes- Trunk, Hybrid and Link access
IEEE 802.1 Q-in-Q	Supports Double VLAN Tag function for implementing Metro Network topologies.
Private VLAN	The private VLAN supports isolated port access with the uplink port in the switch. Typically, each private VLAN contains many private ports and one given uplink port; each private port is isolated with each other and only communicates with the uplink port for the outgoing data and incoming data to provide client port isolated feature.
Class of Service	IEEE 802.1p class of service; per port 4 priority queues.
Traffic Prioritize	Supports 4 physical queues, weighted run robin queuing (WRR 8:4:2:1) and Strict Priority scheme, which follows 802.1p COS tag and IPv4 ToS/ Diffserv information to prioritize the traffic of your industrial network.
IGMP Snooping	IGMP Snooping v1/v2 /v3 for multicast filtering and IGMP Query mode; also support unknown multicasting process forwarding policies- drop, flooding and forward to router port.
Rate Control	Ingress filtering for Broadcast, Multicast, Unknown DA or all packets. Egress filtering for all packet types.
Port Mirroring	Online traffic monitoring on multiple selected ports
Port Security	Port security to assign authorized MAC to specific port
DHCP	DHCP Client, DHCP Server with IP & MAC Address binding and DHCP agent (option 82).
IEEE 802.1x with Radius Server Authentication	Port based network access control and also supports user authenticate by the radius account, password and key for the radius server authentication.
Network Redundancy	
Multiple Super Ring (MSR)™	New generation Korenix Ring Redundancy Technology, Includes Rapid Super Ring, Rapid Dual Homing, TrunkRing™, MultiRing™ and backward compatible with legacy Super Ring™.
Rapid Dual Homing (RDH)™	Multiple uplink paths to one or multiple upper switch
TrunkRing™	Integrate port aggregate function in ring path to get higher throughput ring architecture
MultiRing™	Couple or multiple up to 16 Rapid Super Rings, 9-port Gigabit Switch supports up to 4 Gigabit Rings in one Switch.
Rapid Spanning Tree	IEEE802.1D-2004 Rapid Spanning Tree Protocol. Compatible with Legacy Spanning Tree and IEEE 802.1w

Multiple Spanning Tree	IEEE802.1s MSTP, each MSTP instance can include one or more VLANs. Supports multiple RSTP deployed in a VLAN or multiple VLANs
Loop Protection	The Loop protection enable the looping issue eliminates faster and prevents port looping caused by RSTP protocol.
Interface	
Enclosure Port	10/100/1000TX: 9 x RJ-45 Fast Ethernet/ Gigabit Fiber: 5 x SFP socket RS-232 interface: RJ-45 connector Alarm Relay, Digital Input: 4 pint removable terminal block Power connector: 4-pin removable terminal block
Cables	10Base-T: 2-pair UTP/STP Cat. 3, 4, 5 cable, EIA/TIA-568B 100-ohm (100m) 100 Base-TX: 2-pair UTP/STP Cat. 5 cable, EIA/TIA-568B 100-ohm (100m) 1000 Base-T: 4-pair UTP/STP Cat. 5 cable, EIA/TIA-568B 100-ohm (100m)
RS-232 serial interface	Isolated serial interface
LED Indicators	10/100/1000 RJ-45 port: Link (Green on) / Activity (Blinking), 1000Mbps (Yellow on) SFP port: Link (Green on)/Activity (Blinking), 1000Mbps (Yellow on) System Power: Power on (Green on) Alarm Relay Output: Relay Activate (Red on) Digital Input: Signal input (Green on)/ No signal (Green off) System Status: System ready (Green on), Indication (Green Blinking) Ring Status: Green on (Ring normal) / Blinking (Ring with wrong port), Yellow on (Ring abnormal) / Blinking (device's ring port failed)
Power Requirements	
System Power	2 power inputs with redundancy and polarity reverse protection; supports positive /negative power system. Input voltage: DC24V, range 10.5~60V
Power Consumption	20Watts / DC 24V
Mechanical	
Installation	DIN Rail & Panel Mounting
Case	Aluminum metal case with Ingress protection grade-31
Dimension	95 x 160 x 136 (W x H x D) / with DIN Rail Clip 95 x 160 x 127.2 (W x H x D) / without DIN Rail Clip

Weight	1440g without package
Environmental	
Operating Temperature	Gerneral Op. model: -25~70˚C Wide Temp. model: -40~75˚C UL 60950-1 environment: -25~60˚C or -40~60˚C
Operating Humidity	0% ~ 90%, non-condensing
Storage Temperature	-40˚C ~ 85˚C
Hi-Pot Insulation	AC 1.5KV for all ports and power
Regulatory Approvals	
EMC Note-2	Compliance with the EMC of EN50155 Railway applications -Electronic equipment used on rolling stock – EN 50121-3-2, EN50121-4 and Heavy Industrial applications inquire standards- IEC 61000-6-2, IEC 61000-6-4 Compliance with IEC 60945 EMC class A standard for machinery spaces, control and pump room. **EMI** FCC Class A, CE/ EN55022 Radiation, Conduction **EMS** EN61000-4-2, EN61000-4-3, EN61000-4-4, EN61000-4-5, EN61000-4-6, EN61000-4-8
Vibration	IEC60068-2-6 Note-2
Shock	IEC60068-2-27 Note-2
Free Fall	IEC60068-2-32 with package Note-3
Warranty	Global 5 years

Note-2: pending
Note-3: Korenix's internal testing
Note-4: For the latest version specification, please contact your sales window or distributor.

Ordering Information

JetNet 6059G	**Industrial 9-port Gigabit Managed Ethernet Switch, 4 TX, 5 TX/SFP combo, -25~70˚C operating temperature**
JetNet 6059G-w	**Industrial 9-port Gigabit Managed Ethernet Switch, 4TX, 5TX/SFP combo, -40~75˚C operating temperature**
Packing Includes	
	■ JetNet Switch (without SFP transceiver) x1
	■ Wall mounting plate x1 set
	■ Quick Installation Guide x1
	■ Documentation CD-ROM x1

	■ RS-232 console Cable x1

5.2 Korenix SFP family

Korenix certificated many types of SFP transceiver. These certificated SFP transceivers can be identified by Managed Gigabit Switch and displayed in the UI. The SFP transceivers we certificated can meet up the industrial critical environment needs. We recommend you to use Korenix certificated SFP transceivers when you constructing your network.

Korenix will keep on certificating and updating the certificated SFP transceivers in Korenix web site and purchase list. You can refer to the web site to get the latest information about SFP transceivers.

Note: the poor SFP transceivers quality may results in poor network performance or can't meet up claimed distance or temperature.

The Groups of SFP Transceiver supported for 9-port Gigabit Managed Switch

100Mbps SFP Transceiver group, duplex-LC type connectors

100Mbps SFP Transceiver with Digital Diagnostic Monitoring (DDM) group, duplex-LC type connectors

100Mbps SFP Transceiver , BIDI/WDM group, simplex-LC type connector

100Mbps SFP Transceiver with Digital Diagnostic Monitoring (DDM), BIDI/WDM group, simplex-LC type connector

Gigabit SFP Transceiver group, duplex-LC connectors

Gigabit SFP Transceiver with Digital Diagnostic Monitoring (DDM) group, duplex-LC type connectors

Gigabit SFP Transceiver, BIDI/WDM group, simple-LC type connector

Gigabit SFP Transceiver with Digital Diagnostic Monitoring (DDM) group, BIDI/WDM group, simple-LC type connector

The detail SFP transceiver specification, you can get from the Korenix Web **http://www.korexnix.com/**

5.3 Korenix Private MIB

Korenix provides many standard MIBs for users to configure or monitor the switch's configuration by SNMP. But, since some commands can't be found in standard MIB, Korenix provides Private MIB to meet up the need. Compile the private MIB file by your SNMP tool. You can then use it.

Private MIB tree is the same as the web tree. This is easier to understand and use. If you are not familiar with standard MIB, you can directly use private MIB to manage /monitor the switch, no need to learn or find where the OIDs of the commands are MIB can be found in product CD or downloaded from Korenix Web site with the latest version firmware release.

The path of the JetNet 6059G is 1.3.6.1.4.1.24062.2.4.1 as figure below.

Name:	jetnet6059G
Type:	OBJECT-IDENTIFIER
OID:	1.3.6.1.4.1.24062.2.4.1
Full path:	iso(1).org(3).dod(6).internet(1).private(4).enterprises(1).korenix(24062).products(2).managedGESwitch(4).jetnet6059G(1)
Module:	Jetnet6059G
Parent:	managedGESwitch
First child:	systemInfo

The JetNet 6059G's private MIB supports various of MIB entries, which are system basic setting, port configuration, network redundancy, VLAN, traffic priority,multicasting, snmp, security, system warning, monitoring and configuration saving. User can monitoring and configures JetNet 6059G by SNMP MIB browser tools and through those MIB entries to achieve remote management.

The Private MIB includes 12 major entries for system configuration and monitoring as below listing:

System information: read only

Basic Setting MIB entry: read and write

Port Configuration MIB entry: Read and Write

Network redundancy MIB entry: Read and Write

Vlan MIB entry: Read and Write

Traffic prioritization MIB entry: Read and Write

Multicast Filtering MIB entry: Read and Write

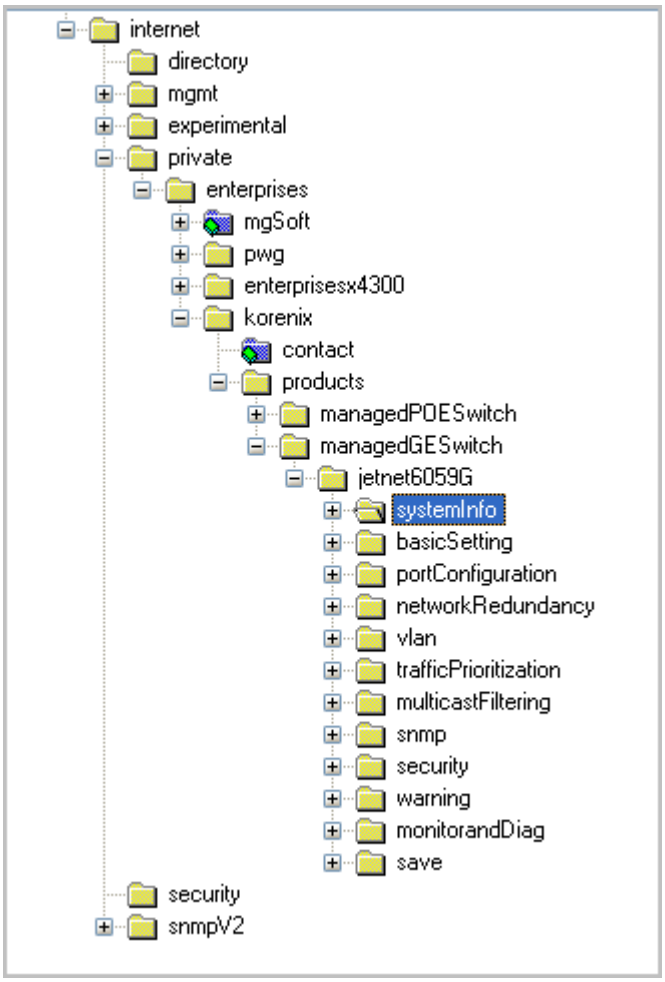
SNMP MIB entry: Read and write

Security MIB entry: Read and write

Warning MIB entry: Read and write

Monitor and Diag: Read and write

Save MIB entry: write only

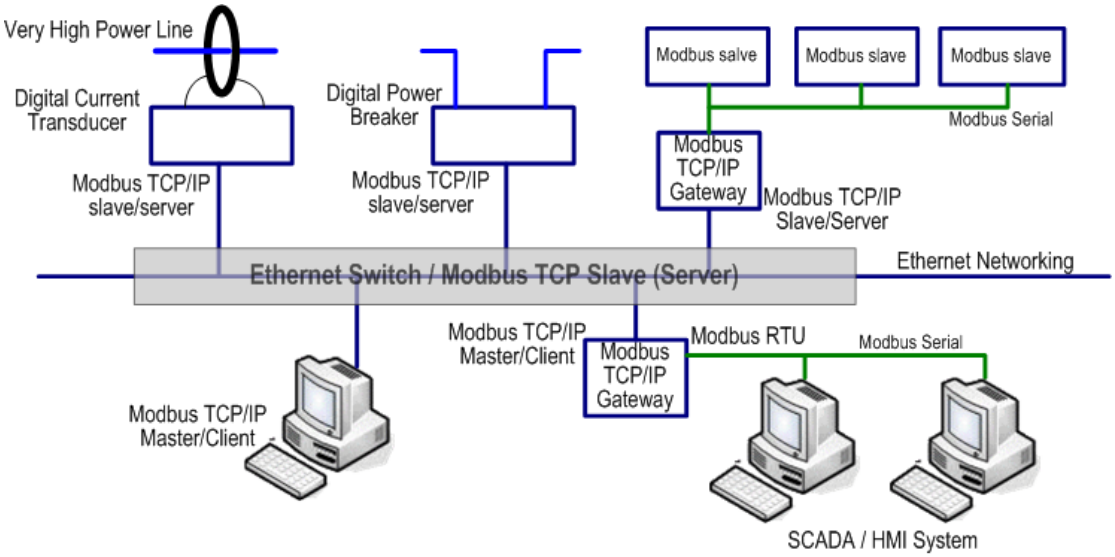


5.4 Modbus TCP protocol

The Modbus TCP is very similar to Modbus RTU, but transmists data within TCP/IP Data packets. It was developed in 1979 for industrial automatic communication system and have becomes a standard protocol for industrial communication for the transfer discrete analogi I/O devices or PLC systems. It defines a simple protocol data unit independent of the underlying data link layer. The modbus TCP packet includes 3 parts - MBAP header, function code and data payload, the MBAP header is used on TCP/IP header to identify the Modbus application Data Unit and provides some differences compared to the MODBUS RTU application data unit used on serial line. The MBAP header also includes unit indentifier to recognize and communicate between multiple independent modbus end units.

The modbus devices communicate using a master (client) /slave (server) architecture, only one device can initiate transaction and the others respond to

the master/client. The other devices (slave/server) respond by supplying the requested data to the master/client, or by taking the action requested in the query. The slave/server can be any peripheral device (DSC unit, PLC unit, Volt/Current Transducer, network communication switch) which process information and sends the output data to the master using modbus TCP protocol. Korenix JetNet Switch operating as slave/server devices, while a typical master/client device is host computer running appropriate application software, like as SCADA / HMI system. The transction architecture like as the drawing following.



There are three most common Modbus versions, Modbus ASCII, Modbus RTU and Modbus TCP. Ethernet based device, Industrial Ethernet Switch for example, supports Modbus TCP that it can be polled through Ethernet. Thus the Modbus TCP master can read or write the Modbus registers provided by the Industrial Ethernet Switch.

The JetNet Managed DIN-Rail Ethernet Switch has implement modbud/TCP register in the firmware. Those register mapping to some of Ethernet Switchs' operating information, includes decription, IP address, power status, interface status, interface information and inbound/outbound packet statistics. With the register supports, user can read the information through their own Modbus TCP based progress/ display/ monitor applications and monitor the status of the switch easily.

The configuration of Modbus/TCP only present in CLI management mode and the no extra user interface for Web configuration.

5.4.1 Modbus Function Code

The Modbus TCP device uses a subset of the standard Modbus TCP function

code to access device-dependent information. Modbus TCP function code is defined as below.

FC	Name	Usage
01	Read Coils	Read the state of a digital output
02	Read Input Status	Read the state of a digital input
03	Read Holding Register	Read holding register in 16-bits register format
04	Read Input Registers	Read data in 16-bits register format
05	Write Coil	Write data to force a digital output ON/OFF
06	Write Single Register	Write data in 16-bits register format
15	Force Multiple Coils	Write data to force multiple consecutive coils

The JetNet device supports the function code 04, which name is Read Input Registers. With this support, the remove SCADA or other Modbus TCP application can poll the information of the device and monitor the major status of the switch.

5.4.2 Error Checking

The utilization of the error checking will help eliminate errors caused by noise in the communication link. In Modbus TCP mode, messages include an error-checking field that is based on a Cyclical Redundancy Check (CRC) method. The CRC filed checks the contents of the entire message. It applied regardless of any parity check method used for the individual BYTE acters of the message. The CRC value is calculated by the transmitting device, which appends the CRC to the message. The receiving device recalculates a CRC during receipt of the message, and compares the calculated value to the actual value it received in the CRC filed.

5.4.3 Exception Response

If an error occurs, the slave sends an exception response message to master consisting of the slave address, function code, exception response code and error check field. In an exception response, the slave sets the high-order bit (MSB) of the response function code to one. The exception response codes are listed below.

Code	Name	Descriptions
01	Illegal Function	The message function received is not

		allowable action.
02	Illegal Data Address	The address referenced in the data field is not valid.
03	Illegal Data Value	The value referenced at the addressed device location is no within range.
04	Slave Device Failure	An unrecoverable error occurred while the slave was attempting to perform the requested action.
05	Acknowledge	The slave has accepted the request and processing it, but a long duration of time will be required to do so.
06	Slave Device Busy	The slave is engaged in processing a long-duration program command.
07	Negative Acknowledge	The slave cannot perform the program function received in the query.
08	Memory Parity Error	The slave attempted to read extended memory, but detected a parity error in the memory.

5.4.4 Modbus TCP register table

Word Address	Data Type	Description
System Information		
0x0000	16 words	Vender Name = “Korenix” Word 0 Hi byte = ‘K’ Word 0 Lo byte = ‘o’ Word 1 Hi byte = ‘r’ Word 1 Lo byte = ‘e’ Word 2 Hi byte = ‘n’ Word 2 Lo byte = ‘l’ Word 2 Hi byte = ‘x’ Word 2 Lo byte = ‘\0’ (other words = 0)
0x0010	16 words	Product Name = "JetNet5828G" Word 0 Hi byte = ‘J’ Word 0 Lo byte = ‘e’ Word 1 Hi byte = ‘T’ Word 1 Lo byte = ‘N’ Word 2 Hi byte = ‘e’ Word 2 Lo byte = ‘t’ Word 3 Hi byte = ‘5’

		Word 3 Lo byte = ‘8’ Word 4 Lo byte = ‘2’ Word 4 Hi byte = ‘8’ Word 5 Lo byte = ‘G’ Word 5 Hi byte = ‘\0’ (other words = 0)
0x0020	128 words	SNMP system name (string)
0x00A0	128 words	SNMP system location (string)
0x0120	128 words	SNMP system contact (string)
0x01A0	32 words	SNMP system OID (string)
0x01C0	2 words	System uptime (unsigned long)
0x01C2 to 0x01FF	60 words	Reserved address space
0x0200	2 words	hardware version
0x0202	2 words	S/N information
0x0204	2 words	CPLD version
0x0206	2 words	Boot loader version
0x0208	2 words	Firmware Version Word 0 Hi byte = major Word 0 Lo byte = minor Word 1 Hi byte = reserved Word 1 Lo byte = reserved
0x020A	2 words	Firmware Release Date Firmware was released on 2010-08-11 at 09 o’clock Word 0 = 0x0B09 Word 1 = 0x0A08
0x020C	3 words	Ethernet MAC Address Ex: MAC = 01-02-03-04-05-06 Word 0 Hi byte = 0x01 Word 0 Lo byte = 0x02 Word 1 Hi byte = 0x03 Word 1 Lo byte = 0x04 Word 2 Hi byte = 0x05 Word 2 Lo byte = 0x06
0x020F to 0x2FF	241 words	Reserved address space
0x0300	2 words	IP address Ex: IP = 192.168.10.1 Word 0 Hi byte = 0xC0

		Word 0 Lo byte = 0xA8 Word 1 Hi byte = 0x0A Word 1 Lo byte = 0x01
0x0302	2 words	Subnet Mask
0x0304	2 words	Default Gateway
0x0306	2 words	DNS Server
0x0308 to 0x3FF	248 words	Reserved address space (IPv6 or others)
0x0400	1 word	AC1 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0401	1 word	AC2 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0402	1 word	DC1 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0403	1 word	DC2 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0404 to 0x040F	12 words	Reserved address space
0x0410	1 word	DI1 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0411	1 word	DI2 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0412	1 word	DO1 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0413	1 word	DO2 0x0000:Off

		0x0001:On 0xFFFF: unavailable
0x0414 to 0x041F	12 words	Reserved address space
0x0420	1 word	RDY 0x0000:Off 0x0001:On

0x2B40 to 0x2B7F	2 words	1024 to maximum size

Note: the modbus TCP client will return 0xFFFF to modbus master when pulling address is empty.

5.4.5 CLI commands for Modbus TCP

The commands of Modbus TCP are listed as following table.

Feature	Command & example
Enable Modbus TCP	Switch(config)# modbus enable
Disable Modbus TCP	Switch(config)# modbus disable
Set Modbus interval time between request	Switch(config)# modbus idle-timeout <200-10000> Timeout vlaue: 200-10000ms Switch(config)# modbus idle-timeout 200 → set interval request time out duration to 200ms.

Set modbus TCP master communicate session.	Switch(config)# modbus master <1-20> Max Modbus TCP Master Switch(config)# modbus master 2 → set maximum modbus master up to 2; maximum support up to 20 modbus communicate sessions.
Set modbus TCP listening port	Switch(config)# modbus port port Listening Port Switch(config)# modbus port 502 ; default modbus TCP service port is 502.

5.5 Revision History

Edition	Date	Modifications
V 0.1	22,Oct,2010	New edittion39 Firmware version V0.1.39 with more system information, ex date of manufacture, serial number.
V0.2	10-DEC,2010	Modify: 1. power input range 10.5~60V DC 2. relay contactor voltage: 1A / DC24V 3. modify interface name to gigaethernet
V03	13-DEC,2010	1. Modify System dimension drawing. 2. Change the speed & link mode from 10H, 100/1000 H/F to 10H/F, 100H/F, 1000F. 3. confirmed the input lowest voltage is 10.5V
V0.4	20-DEC,2010	1. Change RS-232 pin out assignment for the DB-9 connector.
V1.1	May-2011	Add UL 60950-1 operating temperature range in feature and specification. Add LACP logtime / shorttime. Add MSTP / Private VLAN/ Q-in-Q features. Change dimension drawing, add LPS power only for UL 60950-1, add uses UL recongnized SFP fiber transceiver with class 1 laser diode only. Change manual version from 0.4 to 1.1 and sync to firmware version 1.1 Add notification for the power system, console and SFP Fiber / RJ link.
V1.1a	DEC-2011	Web UI supports simplified Chinese language Add Modbus TCP/IP protocol description. Modify Daylight saving input method.
V1.2	Sep-2012	New features for V1.2 Sep-2012, and firmware v1.2: 1. Supports IPv6 function 2. Fully DHCP Relay server function 3. Port STP Enable/Disable function 4. Ring event, Multiple Event Relay Binding 5. Add Loop Protection 6. Update standard

5.6 About Korenix

Less Time At Work! Fewer Budget on applications!

The Korenix business idea is to let you spend less time at work and fewer budget on your applications. Do you really want to go through all the troubles but still end up with low quality products and lousy services? Definitely not! This is why you need Korenix. Korenix offers complete product selection that fulfills all your needs for applications. We provide easier, faster, tailor-made services, and more reliable solutions. In Korenix, there is no need to compromise. Korenix takes care of everything for you!

Fusion of Outstandings

You can end your searching here. Korenix Technology is your one-stop supply center for industrial communications and networking products. Korenix Technology is established by a group of professionals with more than 10 year experience in the arenas of industrial control, data communications and industrial networking applications. Korenix Technology is well-positioned to fulfill your needs and demands by providing a great variety of tailor-made products and services. Korenix's industrial-grade products also come with quality services. No more searching, and no more worries. Korenix Technology stands by you all the way through.

Core Strength---Competitive Price and Quality

With our work experience and in-depth know-how of industrial communications and networking, Korenix Technology is able to combine Asia's research / development ability with competitive production cost and with quality service and support.

Global Sales Strategy

Korenix's global sales strategy focuses on establishing and developing trustworthy relationships with value added distributors and channel partners, and assisting OEM distributors to promote their own brands. Korenix supplies products to match local market requirements of design, quality, sales, marketing and customer services, allowing Korenix and distributors to create and enjoy profits together.

Quality Services

KoreCARE--- KoreCARE is Korenix Technology's global service center, where our professional staffs are ready to solve your problems at any time and in real-time. All of Korenix's products have passed ISO-9000/EMC/CE/FCC/UL certifications, fully satisfying your demands for product quality under critical industrial environments. Korenix global service center's e-mail is koreCARE@korenix.com

5 Years Warranty

Each of Korenix's product line is designed, produced, and tested with high industrial standard. Korenix warrants that the Product(s) shall be free from defects in materials and workmanship for a period of five (5) years from the date of delivery provided that the Product was properly installed and used. This warranty is voided if defects, malfunctions or failures of the warranted Product are caused by damage resulting from force measure (such as floods, fire, etc.), environmental and atmospheric disturbances, other external forces such as power line disturbances, host computer malfunction, plugging the board in under power, or incorrect cabling; or the warranted Product is misused, abused, or operated, altered and repaired in an unauthorized or improper way
