

# CONFIGURATION – BIOS-CUSTOMISATION

An x86-compatible computer hardware requires a BIOS (Basic Input/Output System) or, more recently, a UEFI (Unified Extensible Firmware Interface). This so-called firmware makes the hardware ready for operation and starts the operating system. Among other things, many hardware functions are activated and configured via the BIOS.

We usually adopt the settings specified by the board manufacturer in the UEFI BIOS by default, but we also make customised adjustments.

## BIOS-CUSTOMISATION

Order description	BIOS-Customisation Settings	BIOS-Customisation Desktop Management Interface	BIOS-Customisation Personalisation
Order number	R10265	R10254	R10266
Customisation of the BIOS settings according to individual customer specifications. " Frozen " as the new default settings	✓	✓	✓
Individual entries in the Desktop Management Interface (DMI) for unique identification of the system: serial number, UUID, manufacturer, product and customer name, etc. .		✓	✓
Further individualisation, e.g. integration of an individual customer logo			✓

### YOUR ADDED VALUE

- > You save time during commissioning, as the BIOS settings are already have already been made.
- > Safe operation as the BIOS setting and version do not change.

### SETTINGS

This is also called BIOS or UEFI settings, which we are happy to optimise for the system and your application according to your specifications and "freeze", i.e. store in the CMOS in such a way that the settings are not lost even if the CMOS battery fails.

### MODIFICATIONS

We include among the BIOS/UEFI modifications, for example, the customisation of the boot logo. Wouldn't it be nice to see your own logo when booting your system?

### FIXATION

Since BIOS versions are also optimised and adapted over time, it is not guaranteed that a new BIOS version is compatible with your application. Therefore, we offer a fixation of the BIOS version. In this case, the mainboard is always loaded with the same BIOS version that we have saved for you.
